Chagas disease, leishmaniasis, and sleeping sickness affect 20 million people worldwide and lead to 10 more than 50,000 deaths annually¹. The diseases are caused by infection with the kinetoplastid 11 parasites Trypanosoma cruzi, Leishmania spp. and Trypanosoma brucei spp., respectively. These 12 parasites have similar biology and genomic sequence, suggesting that all three diseases could be 13 cured with drug(s) modulating the activity of a conserved parasite target². However, no such 14 15 molecular targets or broad spectrum drugs have been identified to date. Here we describe a selective inhibitor of the kinetoplastid proteasome (GNF6702) with unprecedented in vivo efficacy, 16 which cleared parasites from mice in all three models of infection. GNF6702 inhibits the 17 kinetoplastid proteasome through a non-competitive mechanism, does not inhibit the mammalian 18 proteasome or growth of mammalian cells, and is well-tolerated in mice. Our data provide genetic 19 and chemical validation of the parasite proteasome as a promising therapeutic target for treatment 20 of kinetoplastid infections, and underscore the possibility of developing a single class of drugs for 21 these neglected diseases. 22

23	Kinetoplastid infections affect predominantly poor communities in Latin America, Asia and Africa.
24	Available therapies suffer from multiple shortcomings, and new drug discovery for these diseases is
25	limited by insufficient investment ³ . We sought low molecular weight compounds with a growth
26	inhibitory effect on Leishmania donovani (L. donovani) ^{4,5} , Trypanosoma cruzi (T. cruzi) ^{6,7} and
27	<i>Trypanosoma brucei</i> (<i>T. brucei</i>) ^{5,8} . Our approach was to test 3 million compounds in proliferation assays
28	on all three parasites (Supplementary Information Tables 1-3), followed by triaging of active compounds
29	(half-maximum inhibitory concentration value $EC_{50} < 10 \ \mu M$) to select those with a clear window of
30	selectivity (>5-fold) with respect to growth inhibition of mammalian cells. An azabenzoxazole,
31	GNF5343, was identified as a hit in the L. donovani and T. brucei screens. Although GNF5343 was not
32	identified in the T. cruzi screen, we noted potent anti-T. cruzi activity of this compound in secondary
33	assays.
34	Optimization of GNF5343 involved the design and synthesis of ~3,000 compounds, and focused on
35	improving bioavailability and potency on inhibition of <i>L. donovani</i> growth within macrophages (Fig. 1).
36	A critical modification involved replacement of the azabenzoxazole center with C6-substituted imidazo-
37	and triazolopyrimidine cores, which yielded compounds up to 20-fold more potent on intra-macrophage
38	L. donovani (e.g. GNF2636). Replacement of the furan group with a dimethyloxazole ring reduced the
39	risk of toxicity associated with the furan moiety, and replacement of the chlorophenyl group with a
40	fluorophenyl improved selectivity over mammalian cell growth inhibition (e.g. GNF3849). These
41	changes also resulted in low clearance and acceptable bioavailability. Further substitutions at the core C6
42	position led to GNF6702 and a 400-fold increase in intra-macrophage L. donovani potency compared to
43	GNF5343.

45 mice infected with *L. donovani*¹⁰, oral dosing with GNF6702 effected a more pronounced reduction in

liver parasite burden than miltefosine, the only oral anti-leishmanial drug available in clinical practice⁵ 46 (Fig. 2a). The miltefosine regimen for VL efficacy studies was chosen to approximate the drug plasma 47 concentration of the clinical regimen¹¹. We noted a greater than three log reduction in parasite load after 48 eight day treatment with 10 mg/kg of GNF6702 twice-daily with the free concentration of GNF6702 49 (fraction unbound in plasma=0.063) staying above the L. donovani EC₉₉ value (the concentration 50 inhibiting 99% of intra-macrophage parasite growth in vitro) for the duration of the dosing period 51 (Extended Data Fig. 1a). Characterization of efficacy of ten analogues in the series at various doses 52 revealed a significant correlation ($r^2=0.89$, p<0.01) between i) the ratio of mean free plasma compound 53 concentration to the *L. donovani* EC₉₀ value and ii) reduction of the liver parasite burden. We found that 54 90% parasite burden reduction in the mouse model was achieved when the mean free compound plasma 55 concentration during treatment equaled a 0.94-fold multiple of the L. donovani EC₉₀ value (Fig. 2b). 56 Cutaneous leishmaniasis (CL) affects about a million people per year, causing skin lesions that can 57 resolve into scar tissue¹². In parts of the Middle East, CL has reached epidemic proportions¹³. After 58 footpad infection of BALB/c mice with the dermatotropic *L. major* strain^{14,15}, treatment with GNF6702 at 59 10 mg/kg twice-daily caused a 5-fold decrease in footpad parasite burden and a reduction in footpad 60 swelling (Fig. 2c). Both 3 mg/kg and 10 mg/kg twice-daily regimens of GNF6702 were superior to 30 61 mg/kg once-daily miltefosine regimen (p < 0.01), which translates into ~2-fold higher miltefosine plasma 62 concentration in mice than observed in clinical dosing¹¹. 63

We further tested if GNF6702 can cure additional kinetoplastid parasite infections. An estimated 25% of the 8 million people infected with *T. cruzi* will develop chronic Chagas disease, manifesting as cardiac or intestinal dysfunction^{16,17}. Benznidazole is broadly used for treatment of acute and indeterminate stages of Chagas disease in Latin America^{18,19}. However, benznidazole has side-effects that frequently lead to treatment interruption^{18,20-22} and a better tolerated drug is needed. To model treatment in the indeterminate disease stage, we infected mice with *T. cruzi* parasites and began treatment 35 days after infection, when the immune system of the mice had controlled parasite burden²³. We increased the parasite detection sensitivity by immunosuppressing the mice after 20 days of treatment^{23,24}. In this model, GNF6702 dosed twice-daily at 10 mg/kg matched the efficacy of benznidazole at 100 mg/kg once-daily; all but one treated mice had no detectable parasites in blood, colon or heart tissue, even after 4 weeks of immunosuppression (Fig. 2d).

Finally, we tested GNF6702 in a mouse model of stage II sleeping sickness (human African 75 trypanosomiasis - HAT)²⁵. Mortality of stage II HAT is caused by infection of the CNS and, in this 76 mouse model, luciferase-expressing T. brucei parasites establish a CNS infection by day 21 post-77 infection. GNF6702 was administered at 100 mg/kg once-daily to account for low exposure in the brain 78 relative to the plasma (~10%, Extended Data Fig. 1b). Diminazene aceturate, a stage I drug that poorly 79 80 crosses the blood-brain barrier, effected apparent clearance of parasites from the blood after a single dose, but did not prevent parasite recrudescence 21 days later. By contrast, treatment with GNF6702 for seven 81 days caused a sustained clearance of parasites (days 42 and 92 post-infection in Fig. 2e, Extended Data 82 Fig. 2a, Supplementary Information Tables 4 and 5). Significantly, mice treated with GNF6702 had no 83 detectable parasites in the brain at termination of the experiment, though parasites were clearly detected 84 in the brains of mice treated with diminazene aceturate (Extended Data Fig. 2b, Supplementary 85 Information Table 6). 86

As GNF6702 showed compelling efficacy in four mouse models of kinetoplastid infections: VL, CL, Chagas disease and stage II HAT, we reasoned that mechanistic studies of GNF6702 might identify a pan-kinetoplastid drug target that could inform target-based drug discovery efforts. We attempted to evolve *L. donovani* strains resistant to GNF3943 and GNF8000 (early analogues from the series, Extended Data Fig. 3) through 12 months of parasite culture under drug pressure without success.

However, we were able to select two drug-resistant T. cruzi epimastigote isolates, one resistant to 92 GNF3943, and another to GNF8000. Both T. cruzi lines exhibited at least 40-fold lower susceptibility to 93 GNF6702 than wild type T. cruzi (Extended Data Fig. 4a and 4b). Using whole genome sequencing, we 94 found that the GNF3943-resistant line had a homozygous mutation encoding a substitution of isoleucine 95 for methionine at amino acid 29 in the proteasome beta 4 subunit ($PSMB4^{I29M/I29M}$) and a heterozygous 96 mutation P82L in dynein heavy chain gene. The GNF8000-resistant line had a heterozygous F24L 97 mutation in PSMB4, and four other heterozygous mutations (Extended Data Table 1). We focused our 98 attention on the proteasome as a likely target for the compound series because we found two independent 99 100 mutations in the *PSMB4* gene, and because the proteasome is an essential enzyme in eukaryotic cells. We also note that the *Plasmodium falciparum* proteasome has recently been the target of promising drug 101 discovery efforts for malaria²⁶. 102

We first asked whether two prototypic inhibitors of mammalian proteasome, bortezomib and MG132, 103 could also block T. cruzi growth. Indeed, both compounds inhibited T. cruzi epimastigote proliferation 104 with sub-micromolar potency. However, in contrast to GNF6702, bortezomib and MG132 inhibited 105 proliferation of the two resistant lines (PSMB4^{I29M/I29M}, PSMB4^{wt/F24L}) with comparable potency to the 106 wild type parasites. Additionally, the PSMB4 mutant lines were not resistant to nifurtimox, an anti-107 kinetoplastid drug with an unrelated mechanism of action (Extended Data Fig. 4a and 4b). To determine 108 whether the F24L mutation was sufficient to confer resistance to GNF6702, we engineered T. cruzi 109 epimastigote lines that ectopically expressed either wild type or F24L-mutated PSMB4. Overexpression 110 of PSMB4^{WT} had little effect on the EC₅₀ value for GNF6702, whereas overexpression of PSMB4^{F24L} 111 caused a greater than 10-fold reduction in GNF6702 potency, but not in that of bortezomib (Fig. 3a, 112 Extended Data Fig. 4c). Previously, bortezomib was also shown to inhibit the growth of T. brucei, 113 suggesting that proteasome activity is essential for growth in this parasite as well²⁷. To test whether 114

PSMB4^{F24L} can rescue growth inhibition by GNF6702 in *T. brucei*, we engineered two parasite strains that ectopically expressed wild type and F24L-mutated PSMB4, respectively. Similar to *T. cruzi*, overexpression of PSMB4^{F24L} in *T. brucei* conferred a high level of resistance to GNF6702 (~70-fold shift in EC₅₀ value), while having no effect on parasite susceptibility to bortezomib (Fig. 3b, Extended Data Fig. 4c).

We next asked whether GNF6702 could inhibit any of three T. cruzi proteasome proteolytic activities in 120 biochemical assays. As predicted from the T. cruzi genome²⁸, mass spectrometry analysis of purified T. 121 cruzi proteasome identified seven alpha and seven beta proteasome subunits, including PSMB4 122 (Supplementary Tables 7 and 8). Using substrates that are specific for each of the chymotrypsin-like, 123 trypsin-like and caspase-like proteolytic activities, we found that only the chymotrypsin-like activity of 124 the *T. cruzi* proteasome was inhibited by GNF6702 (IC₅₀=35 nM), while the other two activities were not 125 affected (IC₅₀>10 µM). In contrast, bortezomib inhibited the chymotrypsin-like (IC₅₀=91 nM), the 126 caspase-like (IC₅₀=370 nM) and the trypsin-like (IC₅₀=1.7 μ M) activities. We further found that the 127 chymotrypsin-like activity of the PSMB4^{129M} T. cruzi proteasome was at least 300-fold less susceptible to 128 129 GNF6702 (IC₅₀>10 μ M) and ~3-fold less susceptible to bortezomib (IC₅₀=0.26 μ M), while susceptibility 130 of the other two mutant proteasome proteolytic activities to the two inhibitors were not affected (Fig. 4a, 131 Extended Data Table 2).

We reasoned that if the primary mechanism of parasite growth inhibition by the compound series was through inhibition of the proteasome chymotrypsin-like activity, then the IC_{50} values for this proteolytic activity should correlate with EC_{50} values for parasite proliferation. Indeed, a tight correlation between the two parameters was observed for *L. donovani* axenic amastigotes and *T. brucei* bloodstream form trypomastigotes (r²=0.78 and r²=0.67, respectively) over a 2,000-fold potency range for 317 analogues, thus indicating that inhibition of parasite proteasome activity was driving the anti-parasitic activity of these compounds. We observed a weaker correlation between IC_{50} and EC_{50} values for intracellular *T*.*cruzi* ($r^2=0.36$, p<0.01), perhaps reflecting more complex cellular pharmacokinetics resulting from compounds having to access *T*. *cruzi* parasites within the cytosol of mammalian cells (Fig. 4b, Extended Data Fig. 5).

Both resistant T. cruzi lines retained sensitivity to bortezomib, which is a substrate-competitive inhibitor, 142 suggesting that GNF6702 might have an alternative mode of inhibition. A Lineweaver-Burk plot of 143 chymotrypsin-like activity at increasing concentrations of peptide substrate showed that GNF6702 has a 144 non-competitive mode of inhibition clearly distinct from the competitive mechanism described for 145 MG132 and bortezomib^{29,30}. We were also able to extend these observations to proteasome from L. 146 147 donovani (Fig. 4c, Extended Data Table 3). We further note that GNF6702 had no measurable activity on the human proteasome (Fig. 4d, Extended Data Table 2). Interestingly, human proteasome beta 4 subunit 148 has a methionine at the 29th amino acid position, mirroring the I29M mutation in the GNF3943-resistant 149 T. cruzi line (Extended Data Fig. 6a). 150

In summary, GNF6702 blocks the chymotrypsin-like activity harbored by the beta 5 subunit without competing with substrate binding, and mutations in the beta 4 subunit, which is in direct physical contact with the beta 5 subunit, confer resistance to this inhibition. Next we used homology modeling of the *T*. *cruzi* proteasome to look for evidence of an allosteric inhibitor binding site. In the *T. cruzi* proteasome model, the F24 and I29 beta 4 residues are positioned at the interface between the beta 4 and beta 5 subunits, on the outer limit of the beta 5 active site. Adjacent to these two beta 4 residues and the beta 5 active site is a plausible binding pocket for GNF6702 (Extended Data Fig. 6b and 6c).

Finally, we tested whether GNF6702 can inhibit proteasome activity in intact *T. cruzi* cells. Cellular proteins entering the proteasome degradation pathway are first tagged with ubiquitin, and proteasome inhibition results in intracellular accumulation of ubiquitylated proteins. Treatment of *T. cruzi*

161 epimastigotes with GNF6702 led to significant buildup of ubiquitylated proteins (Extended Data Fig. 7a) 162 with the half-maximal effect (EC₅₀) achieved at 130 nM compound concentration (Extended Data Fig. 7c). This EC_{50} value correlated well with the half-maximal growth inhibitory concentration of GNF6702 163 164 on T. cruzi epimastigotes (EC₅₀=150 nM; Extended Data Fig. 4b). For comparison, similar experiments with bortezomib yielded comparable inhibitor potencies in the two T. cruzi assays (ubiquitylation 165 166 $EC_{50}=62$ nM vs growth inhibition $EC_{50}=160$ nM; Extended Data Fig. 4b and 7c). We did not observe any detectable accumulation of ubiquitylated proteins in mammalian 3T3 cells treated with GNF6702 167 (Extended Data Fig. 7b and 7c), further confirming high selectivity of this compound. 168

Validation of the parasite proteasome as the target of GNF6702 is supported through several lines of evidence: i) point mutations in the *PSMB4* gene are sufficient to confer resistance to biochemical proteasome inhibition and cellular *T. cruzi* growth inhibition; ii) GNF6702 is a selective inhibitor of parasite proteasome activity and does not inhibit the human proteasome, mirroring the selective inhibition of parasite growth over mammalian cell growth; and iii) potency of GNF6702 and analogues in parasite proteasome assays predict potency in parasite growth inhibition assays.

175 In this work we show that in mouse disease models, GNF6702 was able to eradicate parasites from diverse niches that included the cytosol (T. cruzi), phagolysosome (L. donovani, L. major) of infected 176 host cells, and brain (T. brucei). GNF6702 has also good pharmacokinetic properties, and the compound 177 did not show activity in panels of human receptor, enzyme and ion channel assays (Supplementary 178 Tables 9-11). Going forward, GNF6702, or analogues thereof, has potential to yield a new treatment for 179 180 several kinetoplastic infections and it is currently being evaluated in preclinical toxicity studies. It is unclear if the clinical utility of GNF6702 could extend to the treatment of stage II HAT as GNF6702 was 181 tested in the HAT mouse model only at one high dose (100 mg/kg once-daily). We also note that 182 183 identification of a broadly active pan-kinetoplastid drug might not be feasible (or desirable) as such a drug would need to reach high concentrations in varied tissues/subcellular compartments, and might carry increased toxicity risk. Instead, alternative analogues from this series with different pharmacological profiles might be needed for treatment of different kinetoplastid infections. Nevertheless, there are only scarce resources for drug development in these diseases, and identification of a common target and chemical scaffold with potential across multiple indications provides new hope for improved treatment options for some of the world's poorest people.

300 FIGURE LEGENDS

Figure 1: Chemical evolution of GNF6702 from the phenotypic hit GNF5343. *L. donovani*:

amastigotes proliferating within primary mouse macrophages; *T. brucei*: the bloodstream form

- trypomastigotes; *T. cruzi*: amastigotes proliferating in 3T3 fibroblast cells; macrophage: mouse primary
- peritoneal macrophages; EC_{50} and CC_{50} : half-maximum growth inhibition concentration; F: oral
- bioavailability in mouse after administering single compound dose (20 mg/kg) as a suspension; CL:
- plasma clearance in mouse after single iv bolus dose (5 mg/kg); N.D.: not determined; all EC_{50} and CC_{50}

307 values correspond to means \pm s.e.m. (n=4 technical replicates).

Figure 2: GNF6702 clears parasites in mouse models of kinetoplastid infections. a, Post-treatment *L*.

309 *donovani* liver burdens in mouse model of VL as assessed by qPCR (n=5 mice). **b**, PK/PD relationship

for ten GNF6702 analogues, each administered at several doses; circles: mean liver burdens associated

- 311 with individual compound regimens (30 regimens in total; n=5 mice per regimen) relative to vehicle;
- horizontal dotted line: 90% reduction in the liver *L. donovani* burden; vertical dotted line: 0.94-fold
- multiple of the mean free compound plasma concentration/ the L. donovani EC_{90} value ratio. c, Post-
- treatment *L. major* footpad burdens in the BALB/c mouse model of CL as assessed by qPCR (n= 6 mice);

315 the p values (two-tailed distribution) relate parasite burdens in compound-treated mice with those from 316 vehicle-treated mice; left inset picture: a representative mouse footpad after treatment with vehicle; right inset picture: a representative mouse footpad after treatment with GNF6702 10 mg/kg twice-daily 317 318 regimen. **d**, *T. cruzi* burden in mouse blood (circles), colon (triangles) and heart (diamonds) as assessed by qPCR after 20 days of treatment and four weeks of immunosuppression (n=8 mice). e, Whole body in 319 vivo imaging of bioluminescent T. brucei before and after treatment; Trypanosoma brucei-infected mice 320 321 were treated by a single intraperitoneal injection of diminazene aceturate (n=3 mice) or by oral administration of GNF6702 once-daily for 7 days (n=6 mice); filled symbols show whole body 322 323 bioluminescence values for individual mice; several mice from the untreated and diminazene aceturate-324 treated groups were euthanized between days 28 and 56 due to CNS infection symptoms; background bioluminescence values shown for uninfected mice (grey-filled squares; n=4) were collected 325 326 independently from mice aged-matched for day 0 using the same acquisition settings. Red dotted lines in 327 a, c and d plots show limit of parasite detection by qPCR; plot symbols below the red dotted line: mice with no detectable parasites; data points below the limit of detection are 'jittered' to show number of 328 329 animals in a group; thick horizontal lines: means of the treatment groups; RU: relative units (parasite 330 burden relative to the mean burden of the vehicle-treated group).

Figure 3: F24L mutation in proteasome beta 4 subunit confers selective resistance to GNF6702. a, growth inhibition of *T. cruzi* epimastigote strains ectopically expressing PSMB4^{WT} or PSMB4^{F24L} protein by GNF6702 and bortezomib; non-induced/induced: culture medium without/with tetracycline to modulate expression of tetracycline-inducible *PSMB4* genes. b, growth inhibition of *T. brucei*bloodstream form trypomastigotes constitutively overexpressing PSMB4^{WT} or PSMB4^{F24L} protein by GNF6702 and bortezomib. EC₅₀ values for each strain/compound pair are listed inside a and b plot panels next to corresponding strain/compound symbol (defined in plot legends); means from n=3

338 technical replicates are shown; error bars represent s.e.m. values; for data points lacking error bars, s.e.m. 339 values are smaller than circles representing means; due to limited aqueous solubility, the highest tested GNF6702 concentration was 10 μ M. RU (relative units) in **a** and **b** corresponds to parasite growth 340 341 relative to the DMSO control (%). Figure 4: Compounds from GNF6702 series inhibit growth of kinetoplastid parasites by inhibiting 342 343 parasite proteasome chymotrypsin-like activity. a, Inhibition of three proteolytic activities of purified wild type (PSMB4^{WT}) and PSMB4^{I29M} T. cruzi proteasomes by GNF6702 and bortezomib; IC₅₀ values 344 for proteasome proteolytic activities are listed inside plots. **b**, Correlation between inhibition of 345 346 chymotrypsin-like activity of purified L. donovani proteasome (IC₅₀) and L. donovani axenic amastigote growth inhibition (EC₅₀; data points correspond to means of 2 technical replicates); red circles: IC₅₀>20 347 μ M; blue circles: EC₅₀>25 μ M; yellow circles: IC₅₀>20 μ M and EC₅₀>25 μ M; data for 317 analogues are 348 shown. c, Lineweaver-Burk plot of inhibition of T. cruzi proteasome chymotrypsin-like activity by 349 GNF6702 at increasing concentrations of a peptide substrate. d, Effect of GNF6702 and bortezomib on 350 351 three proteolytic activities of human constitutive proteasome; IC_{50} values for proteasome proteolytic 352 activities are listed inside plots. Data shown in **a**, **c** and **d** represent means \pm s.e.m. (n=3 technical replicates; for data points lacking error bars, s.e.m. values are smaller than circles representing means). 353 Due to limited aqueous solubility, the highest tested GNF6702 concentration in experiments shown in a 354 and **d** was $10 \,\mu$ M. 355

356 **METHODS**

Ethics statement for animal models. All procedures involving mice were performed in accordance with
 AAALAC standards or under UK Home Office regulations, and were reviewed and approved in
 accordance with the Novartis Animal Welfare Policy. Sample size was determined on the basis of the

360 minimum number of animals required for good data distribution and statistics. Blinding was not possible361 in these experiments but animals were selected randomly for each group.

362 **Determination of IC**₅₀, EC₅₀ and CC₅₀ values, and data correlation. Reported $IC_{50}/EC_{50}/CC_{50}$ values

363 were calculated by averaging $IC_{50}/EC_{50}/CC_{50}$ values obtained from individual technical replicate

- 364 experiments (n; specified in relevant Figure captions and Methods sub-sections). Each technical replicate
- 365 experiment was performed on a different day with freshly prepared reagents. Reported standard errors of

366 mean (s.e.m.) were calculated using $IC_{50}/ EC_{50}/ CC_{50}$ values determined in individual technical replicate

367 experiments. To calculate $IC_{50}/EC_{50}/CC_{50}$ values, measured dose response values were fitted with 4-

- 368 parameter logistic function $y=A+(B-A)/(1+(x/C)^{D})$ (model 201, XLfit, IDBS), where x refers to
- 369 compound concentration and y corresponds to an assay readout value.
- 370 VL efficacy data for ten GNF6702 analogues (Fig. 2a) were fitted with 4-parameter logistic function

 $y=A+(B-A)/(1+(x/C)^D)$ (model 201, XLfit, IDBS), where x values correspond to free mean compound

372 plasma concentrations and y values correspond to $log_{10}(L. donovani liver burden)$.

To correlate parasite proteasome inhibition with parasite growth inhibition (Fig. 4b and Extended data

Fig. 5), we fitted data with y=a*x+b function using the least square method (x corresponds to $log_{10}(IC_{50})$;

375 y corresponds to $log_{10}(EC_{50})$).

376 *Leishmania donovani* axenic amastigote growth inhibition assay. RPMI 1640 medium (HyClone) was

supplemented with 20% heat-inactivated fetal bovine serum (Omega Scientific), 23 μM folic acid

- 378 (Sigma-Aldrich), 100 µM adenosine (Sigma-Aldrich), 22 mM D-glucose (Sigma-Aldrich), 4 mM L-
- 379 glutamine (Hyclone), 25 mM 2-(4-morpholino) ethanesulfonic acid (Sigma-Aldrich) and 100 IU
- 380 penicillin/ 100 μ g/mL streptomycin (HyClone), and adjusted to pH= 5.5 with 6 M hydrochloric acid
- 381 (Fisher Scientific) at 37 °C. *Leishmania donovani* MHOM/SD/62/1S-CL2D axenic amastigotes were

cultured in 10 mL of this medium (Axenic Amastigote Medium) in T75 CELL-STAR flasks (Greiner
Bio-One) at 37 °C/ 5% CO₂ and passaged once a week.

To determine compound growth inhibitory potency on L. donovani axenic amastigotes, 100 nL of serially 384 385 diluted compounds in DMSO were transferred to the wells of white, solid bottom 384-well plates (Greiner Bio-One) by Echo 555 acoustic liquid handling system (Labcyte). Then, 1 x 10³ of *L. donovani* 386 axenic amastigotes in 40 µL of Axenic Amastigote Medium were added to each well, and plates were 387 incubated for 48 hours at 37 °C/ 5% CO₂. Parasite numbers in individual plate wells were determined 388 through quantification of intracellular ATP. The CellTiter-Glo luminescent cell viability reagent 389 390 (Promega) was added to plate wells, and ATP-dependent luminescence signal was measured on an 391 EnVision MultiLabel Plate Reader (Perkin Elmer). Luminescence values in wells with compounds were divided by the average luminescence value of the plate DMSO controls, and used for calculation of 392 393 compound EC_{50} values as described above. Axenic amastigote EC_{50} values shown in Fig. 4b correspond to means of 2 technical replicates. 394 Isolation and maintenance of Leishmania donovani splenic amastigotes. Female BALB/cJ mice 395 396 (Envigo) infected with L. donovani MHOM/ET/67/HU3 (ATCC) for 50-80 days were euthanized, and infected spleens were removed and weighed. The weight of an infected spleen ranged from 300 to 600 397 398 mg. For comparison, spleens from non-infected age-matched BALB/cJ mice weighed ~100 mg. Infected 399 spleens were washed in Axenic Amastigote Medium (composition described above) and placed into 400 Falcon 50 mL conical centrifuge tubes (Fisher Scientific) containing ice-cold Axenic Amastigote 401 Medium (15 mL per infected spleen). Spleens were homogenized on ice in a Dounce homogenizer and 402 centrifuged at 200 x g for 15 minutes at 4 °C to remove tissue debris. *Leishmania donovani* amastigotes 403 present in the supernatant were pelleted by centrifugation at 1,750 x g for 15 min at 4 °C and re-404 suspended either in Axenic Amastigote Medium (when used for *in vitro* macrophage infections) or in

Hanks' Balanced Salt Solution (when used for mouse infections; Hyclone). Suspensions of splenic
amastigotes were kept on ice and used for *in vitro* or *in vivo* infections within 2-3 hours. To propagate *L*. *donovani* amastigotes *in vivo*, 6 to 7 weeks old female BALB/cJ mice were infected with 8 x 10⁷ purified
splenic amastigotes in 200 µL of Hanks' Balanced Salt Solution by tail vein injection. *Leishmania donovani* intra-macrophage amastigote growth inhibition assay. *In vitro* compound
potencies on intra-macrophage *L. donovani* MHOM/ET/67/HU3 were determined using primary murine
peritoneal macrophages infected with *L. donovani* splenic amastigotes. Primary macrophages were

412 elicited in female BALB/c mice for 72 hours following the injection of $500 \,\mu$ L of sterile aqueous 2%

413 starch (J. T. Baker) solution into the mouse peritoneal cavity. The protocol used for isolation of

414 peritoneal macrophages was described in detail previously³¹. The isolated macrophages were re-

suspended in Macrophage Infection Medium (RPMI-1640 medium supplemented with 2 mM L-

glutamine, 10% heat-inactivated fetal bovine serum, 10 mM sodium pyruvate (Hyclone), and 100 IU

417 penicillin/ 100 μ g/mL streptomycin), and 50 μ L of macrophage suspension (8 x 10⁵ macrophages/mL)

were added to microscopy-grade, clear-bottom, black 384-well plates (Greiner Bio-One). Following 418 419 overnight incubation at 37 °C/ 5% CO₂, plate wells were washed with Macrophage Infection Medium to remove non-adherent cells using ELx405 Select microplate washer (BioTek), and then filled with 40 µL 420 of Macrophage Infection Medium. Leishmania donovani HU3 splenic amastigotes isolated from infected 421 spleens were re-suspended in Macrophage Infection Medium at a concentration of 6 x 10^7 cells/mL, and 422 $10 \,\mu\text{L}$ of the suspension were added to assay plate wells containing adherent macrophages. After a 24-423 hour infection period at 37 °C/ 5% CO₂, plate wells were washed with Macrophage Infection Medium to 424 remove residual extracellular parasites and re-filled with 50 µL of the medium. Leishmania donovani-425 426 infected macrophages were subsequently treated with DMSO-dissolved compounds (0.5% final DMSO

427 concentration in the assay medium) in dose response for 120 hours at 37 $^{\circ}C/$ 5% CO₂. Next, treated

- 428 macrophages were washed with the phosphate-buffered saline buffer (PBS; Sigma-Aldrich)
- 429 supplemented with 0.5 mM magnesium chloride (Sigma-Aldrich) and 0.5 mM calcium chloride (Sigma-
- 430 Aldrich), fixed with 0.4% paraformaldehyde (Sigma-Aldrich) in PBS, permeabilized with 0.1% Triton X-
- 431 100 (Sigma-Aldrich) in PBS, and stained with SYBR Green I nucleic acid stain(Invitrogen, 1:100,000
- 432 dilution in PBS) overnight at 4 °C. Image collection and enumeration of macrophage cells and
- 433 intracellular *L. donovani* amastigotes was performed using the OPERA QEHS automated confocal
- 434 microscope system equipped with 20x water immersion objective (Evotec Technologies) and the OPERA
- 435 Acapella software (Evotec Technologies) as described previously 32 .
- 436 All reported intra-macrophage *L. donovani* EC₅₀ values were calculated from at least 3 technical
- 437 replicates (n=3 or n=4; specified in relevant Figure captions).
- 438 *Trypanosoma brucei* growth inhibition assay. Bloodstream form *Trypanosoma brucei* Lister 427
- 439 parasites were continuously passaged in HMI-9 medium formulated from IMDM medium (Invitrogen),
- 440 10% heat-inactivated fetal bovine serum, 10% Serum Plus medium supplement (SAFC Biosciences), 1
- 441 mM hypoxanthine (Sigma-Aldrich), 50 µM bathocuproine disulfonic acid (Sigma-Aldrich), 1.5 mM
- 442 cysteine (Sigma-Aldrich), 1 mM pyruvic acid (Sigma-Aldrich), 39 µg/mL thymidine (Sigma-Aldrich),
- and 14 μ L/L beta-mercapthoethanol (Sigma-Aldrich); all concentrations of added components refer to
- those in complete HMI-9 medium. The parasites were cultured in 10 mL of HMI-9 medium in T75
- 445 CELL-STAR tissue culture flasks at 37 °C/ 5% CO₂.
- 446 To determine compound growth inhibitory potency on *T. brucei* bloodstream form parasites, 100 nL of
- serially diluted compounds in DMSO were transferred to the wells of white, solid bottom 384-well plates
- 448 (Greiner Bio-One) by Echo 555 acoustic liquid handling system. Then, 5×10^3 of *T. brucei* parasites in
- 449 40 μ L of HMI-9 medium were added to each well, and the plates were incubated for 48 hours at 37 °C/ 5%
- 450 CO₂. Parasite numbers in individual plate wells were determined through quantification of intracellular

ATP amount. The CellTiter-Glo luminescent cell viability reagent was added to plate wells, and ATPdependent luminescence signal was measured on an EnVision MultiLabel Plate Reader. Luminescence
values in wells with compounds were divided by the average luminescence value of the plate DMSO

454 controls, and used for calculation of compound EC_{50} values as described above.

455 *Trypanosoma brucei* EC_{50} values shown in Fig. 1 and Extended Data Fig. 3 correspond to means of 4 456 technical replicates.

Trypanosoma cruzi amastigote growth inhibition assay. NIH 3T3 fibroblast cells (ATCC) were 457 maintained in RPMI 1640 medium (Life Technologies) supplemented with 10% heat-inactivated fetal 458 bovine serum and 100 IU penicillin/ 100 µg/mL streptomycin at 37 °C/ 5% CO₂. Trypanosoma cruzi 459 Tulahuen parasites constitutively expressing *Escherichia coli* beta-galactosidase³³ were maintained in 460 tissue culture as an infection in NIH 3T3 fibroblast cells. Briefly, 2 x 10⁷ T. cruzi trypomastigotes were 461 used to infect 6 x 10⁵ NIH 3T3 cells growing in T75 CELL-STAR tissue culture flasks and cultured at 462 37 °C/ 5% CO₂ until proliferating intracellular parasites lysed host 3T3 cells and were released into the 463 culture medium (typically 6-7 days). During the infection, the tissue culture medium was changed every 464 465 two days. Number of T. cruzi trypomastigotes present in one mL of medium was determined using a hemocytometer. 466

To determine compound potency on intracellular *T. cruzi* amastigotes, NIH 3T3 cells were re-suspended in phenol red-free RPMI 1640 medium containing 3% heat-inactivated fetal bovine serum and 100 IU penicillin/ 100 µg/mL streptomycin, seeded at 1,000 cells/ well (40 µL) in white, clear bottom 384-well plates (Greiner Bio-One), and incubated overnight at 37 °C/ 5% CO₂. The following day, 100 nL of each compound in DMSO were transferred to individual plate wells by Echo 555 acoustic liquid handling system. After one hour incubation, 1 x 10⁶ of tissue culture-derived *T.cruzi* trypomastigotes, in 10 µL of phenol red-free RPMI 1640 medium supplemented with 3% heat-inactivated fetal bovine serum and 100

474 IU penicillin/ 100 µg/mL streptomycin were added to each well. Plates were then incubated for 6 days at 475 37 °C/5% CO₂. Intracellular T. cruzi parasites were quantified by measuring the activity of parasiteexpressed beta-galactosidase. Ten microliters of a chromogenic beta-galactosidase substrate solution (0.6 476 477 mM chlorophenol red- β -D-galactopyranoside/ 0.6% NP-40 in PBS; both reagents from Calbiochem) were added to each well and incubated for 2 hours at room temperature. After incubation, absorption was 478 measured at 570 nM on SpectraMax M2 plate reader (Molecular Devices). Measured absorbance values 479 in wells with compounds were divided by the average absorbance value of the plate DMSO controls, and 480 used for calculation of compound EC_{50} values as described above. 481

482 *Trypanosoma cruzi* amastigote EC_{50} values shown in Fig. 1 and Extended Data Fig. 3 correspond to 483 means of 4 technical replicates.

Trypanosoma cruzi epimastigote proliferation assay. Trypanosoma cruzi CL epimastigotes were 484 485 continuously passaged in LIT medium containing 9 g/L liver infusion broth (Difco), 5 g/L bacto-tryptose (Difco), 1 g/L sodium chloride, 8 g/L dibasic sodium phosphate (Sigma-Aldrich), 0.4 g/L potassium 486 chloride (Sigma-Aldrich), 1 g/L D-glucose, 10 % heat-inactivated fetal bovine serum and 10 ng/mL of 487 488 hemin (Sigma-Aldrich). The medium was adjusted to pH=7.2 with 6 M hydrochloric acid. The parasites were cultured in 10 mL of LIT medium in T75 CELL-STAR tissue culture flasks at 27 °C. 489 To determine compound growth inhibitory potency on T. cruzi epimastigotes, 100 nL of serially diluted 490 491 compounds in DMSO were transferred to the wells of white, solid bottom 384-well plates (Greiner Bio-One) by an Echo 555 acoustic liquid handling system. Then, 5 x 10^3 of *T. cruzi* epimastigotes in 40 μ L 492 of LIT medium were added to each well, and the plates were incubated for 7 days at 27 °C. Parasite 493 494 numbers in individual plate wells were determined through quantification of intracellular ATP amount. The CellTiter-Glo luminescent cell viability reagent was added to plate wells, and ATP-dependent 495 496 luminescence signal was measured on an EnVision MultiLabel Plate Reader. Luminescence values in

497 wells with compounds were divided by the average luminescence value of the plate DMSO controls, and 498 used for calculation of compound EC_{50} values as described above.

Trypanosoma cruzi epimastigote EC₅₀ values shown in Extended Data Fig. 4 correspond to means of 3
 technical replicates.

501 Mouse fibroblast NIH 3T3 growth inhibition assay. NIH 3T3 fibroblast cells were maintained in

502 RPMI medium 1640 with glutamine (Life Technologies) supplemented with 5% heat-inactivated fetal

503 bovine serum and 100 IU penicillin/ 100 μg/mL streptomycin (3T3 Medium) at 37 °C/ 5% CO₂. NIH 3T3

fibroblast cells were purchased from ATCC. We did not perform cell line authentication and did not test

the cells for mycoplasma contamination. This cell line is not listed in the database of commonly

506 misidentified cell lines maintained by ICLAC and NCBI Biosample.

507 To determine compound potency, NIH 3T3 cells re-suspended in 3T3 medium were seeded at 1,000

cells/ well (50 μ L) in white 384-well plates (Greiner Bio-One) and incubated overnight at 37 °C/ 5% CO₂.

509 The following day, 100 nL of each compound in DMSO were transferred to individual plate wells by

510 Echo 555 acoustic liquid handling system and plates were incubated for five days at 37 °C/ 5% CO₂. Cell

numbers in individual plate wells were determined through quantification of intracellular ATP amount.

512 The CellTiter-Glo luminescent cell viability reagent was added to plate wells, and ATP-dependent

513 luminescence signal was measured on an EnVision MultiLabel Plate Reader. Luminescence values in

wells with compounds were divided by the average luminescence value of the plate DMSO controls, and

used for calculation of compound CC_{50} values as described above.

NIH 3T3 CC₅₀ values shown in Fig. 1 and Extended Data Fig. 3 correspond to means of 4 technical
replicates.

518 Primary macrophage cytotoxicity assay. Primary macrophage cell viability was determined on mouse
519 peritoneal macrophages infected with *L. donovani* and was expressed as the ratio of the number of

macrophage cells in wells treated with a compound to those in wells treated with DMSO. The number of macrophage cells in wells was determined by high content microscopy as described previously³².

All reported macrophage CC_{50} values were calculated from 4 technical replicates (n= 4; also specified in

523 Figure 1 and Extended Data Figure 3 captions).

524 Selection of GNF3934- and GNF8000-resistant *T. cruzi* mutants. *T. cruzi* epimastigotes cultures

resistant to GNF3943 and GNF8000 were generated using a methodology described previously³². Briefly,

526 epimastigotes were initially cultured in the presence of compound concentration equivalent to its

527 EC₂₀ value (GNF3943 EC₂₀= 1.5 μ M and GNF8000 EC₂₀= 0.2 μ M in 0.2% DMSO) or 0.2% DMSO

528 (control). Once a week, parasites were counted and growth rates were determined. If the parasite cultures

exhibited a reduced growth rate compared to 0.2% DMSO-treated parasites, epimastigotes were cultured

at the same compound concentration. Once the growth rates matched that of the control epimastigote

culture (0.2% DMSO), parasites were transferred into medium containing two-fold higher compound

532 concentration. The process was repeated until significant resistance was achieved (~10- to 20-fold

533 increase in corresponding EC_{50} value). The time required for generation of cultures with such a level of

resistance was approximately five months. Resistant clones were isolated via cloning by limiting dilution,

and two independent clones were analyzed by whole genome sequencing.

536 *T. cruzi* whole genome sequencing. Chromosomal DNA isolation from GNF3943- and GNF8000-

resistant *T. cruzi* clones, whole genome sequencing and sequence analysis were performed as described
 previously³². Sequencing reads were aligned to the *T. cruzi* CL Brenner genome³⁴.

539 Generation of *T. cruzi* strains ectopically expressing proteasome beta 4 subunit variants. *PSMB4*

540 TcCLB503891.100 was amplified from *T. cruzi* CL Brenner genomic DNA using KOD Hot Start DNA

541 Polymerase (EMD Millipore), and sense (5'-AAAGCGGCCGCATGTCGGAGACAACCATTG-3) and

542 antisense (5-CCATGATCTTGATGTAATATAAGGCATTCAGCCCTGCTG-3) primers. The

543	PSMB4 ^{F24L} gene was generated from the wild type PSMB4 construct by site-directed mutagenesis using
544	mutagenic sense (5-CAGCAGGGCTGAATGCCTTATATTACATCAAGATCATGG-3') and antisense
545	(5'-CCATGATCTTGATGTAATATAAGGCATTCAGCCCTGCTG-3') primers and QuikChange II
546	Site-Directed Mutagenesis Kit (Stratagene). The sequences of the wild type and mutant PSMB4 genes
547	were verified by sequencing and both gene versions were subcloned into the T. cruzi expression vector
548	pTcIndex1 under control of a T7 promoter ³⁵ . <i>Trypanosoma cruzi</i> CL Brenner epimastigotes were first
549	transfected as described previously ³⁶ with the pLEW13 plasmid ³⁷ harboring a tetracycline-inducible T7
550	RNA polymerase gene. Transfected epimastigotes were selected in medium supplemented with neomycin
551	(G418) at 500 μ g/ml, and then transfected a second time with either pTcIndex1- <i>PSMB4^{wt}</i> or pTcIndex1-
552	<i>PSMB4</i> ^{<i>F24L</i>} plasmid. Double transfected epimastigotes were selected in the presence of 500 μ g/mL of
553	G418 (Sigma-Aldrich) and 500 μ g/mL of hygromycin (Sigma-Aldrich). Susceptibility of double
554	transfected epimastigote cell lines to compounds was assessed using induced (+5 mg/mL of tetracycline)
555	and non-induced parasite cultures after five days of compound treatment. Parasite viability was
556	determined with AlamarBlue (ThermoFisher Scientific).
557	Reported EC ₅₀ values for <i>T. cruzi</i> epimastigotes ectopically expressing PSMB4 proteins were calculated
558	from 3 technical replicates ($n=3$; also specified in the Figure 3a caption).
559	Generation of <i>T. brucei</i> strains ectopically expressing proteasome beta 4 subunit variants. <i>PSMB4</i>
560	(Tb927.10.4710) was amplified from T. brucei Lister 427 genomic DNA using PCR SuperMix High
561	Fidelity (Invitrogen), sense (5'-GCAAGCTTATGGCAGAGACGACTATCGG-3) and antisense (5'-
562	GCGGATCCCTAGCTTACAGATTGCACTC-3') primers. The <i>PSMB4</i> ^{F24L} gene was generated from the
563	wild type PSMB4 construct by site-directed mutagenesis using mutagenic sense (5'-
564	gctgcggggttaaatgcgttatactacattaagataacgg-3'), antisense (5'-ccgttatcttaatgtagtataacgcatttaaccccgcagc-3')
565	primers and QuikChange II Site-Directed Mutagenesis Kit (Stratagene). The sequences of the wild type

and mutant *PSMB4* genes were verified by sequencing and both gene versions were cloned into the *T*. *brucei* expression vector pHD1034 under control of a ribosomal RNA promoter. Transfected *T. brucei* Lister 427 cells were selected in medium supplemented with puromycin at $1 \mu g/ml$. Susceptibility of transfected *T. brucei* cell lines to compounds were assessed after 2 days of compound treatment. Parasite viability was determined with CellTiter-Glo.

571 Reported EC_{50} values for *T. brucei* parasites ectopically expressing PSMB4 proteins were calculated 572 from 3 technical replicates (n= 3; also specified in the Figure 3b caption).

Purification of parasite 20S proteasomes. T. cruzi CL epimastigotes, L. donovani MHOM/SD/62/1S-573 574 CL2D axenic amastigotes and T. brucei Lister 27 bloodstream form trypomastigotes were grown to log 575 phase and harvested by centrifugation. The corresponding cell pellets were stored at -80 °C until further use. Prior to purification, 10 g of cell pellets were thawed, re-suspended in lysis buffer (50 mM Tris-HCl 576 577 $pH = 7.5, 1 \text{ mM TCEP}, 5 \text{ mM EDTA}, and 10 \mu M E-64), and lysed by passing cell suspension three times$ through a needle (22 gauge) and by subsequent three freeze/ thaw cycles. The lysate was first cleared of 578 cellular debris by two centrifugation steps (15,000 x g at 4 °C for 15 minutes followed by 40,000 x g at 579 580 4 °C for 60 minutes) and then fractionated through ammonium sulfate precipitation. The protein fraction precipitated between 45% and 65% of ammonium sulfate saturation was re-suspended in 25 mM Tris-581 HCl pH = 7.5, 1 mM TCEP buffer, and dialyzed overnight at 4 °C against the same buffer. Proteasomes 582 were further purified by anion exchange chromatography (Resource Q column, GE Healthcare Life 583 Sciences) and size exclusion chromatography (Superose 6 column, GE Healthcare Life Sciences) as 584 described elsewhere³⁸. Active fractions from the latter purification step were pooled and used in 585 586 proteasome biochemical assays.

Subunit composition analysis of purified *T. cruzi* 20S proteasome by LC/MS/MS. Purified *T. cruzi* proteasome sample was buffer-exchanged and concentrated into 100 mM trimethylamine bicarbonate-

589 HCl pH= 8.0, 150 mM NaCl buffer using a 10 kDa molecular weight cut-off micro-concentrator 590 (Milipore Amicon Ultra). The resulting proteasome sample (200 μ l, 1 mg/ml) was mixed with 5 μ l of a 591 TMTsixplex reagent (Pierce). After 60 second incubation to label primary amines, the reaction was 592 stopped by adding 25 µl of 5% hydroxylamine. The labeled sample was run on 4-20% Bis-Tris PAGE gel 593 (Invitrogen) to separate polypeptides. The gel was stained with eStain 2.0 (GenScript). Stained protein 594 bands were cut out and in-gel digested separately with elastase (Promega) and asparaginase (Roche). 595 Peptides generated by the digestions were resolved by HPLC using a vented column setup with a 2 cm 596 Poros 10 R2 (Life Technologies, Carlsbad, CA) self-packed pre-column, and a PepMap Easy-Spray C18 597 analytical column (15 cm x 75 µm ID, Thermo Scientific). Resin-bound proteolytic fragments were eluted with 2 to 40% acetonitrile / 0.1% formic acid operated at 300 nL/min for 120 min. Spectra of 598 eluted peptide species were determined by a column-coupled Q Exactive hybrid quadrupole orbitrap 599 600 mass spectrometer (Thermo Scientific). Proteome Discoverer v1.4 software (Thermo Scientific) was used to search the *T.cruzi* genome²⁸ with identified spectra for presence of 20S proteasome subunits 601 602 (Supplementary Table 7). Search parameters included fixed carbamidomethyl modification of cysteine, 603 and variable oxidation of methionine, deamidation of asparagine, pyro-glu of N-terminal glutamine, and TMT(6-plex) modification of lysine residues. 604

Measuring proteasome proteolytic activities. The activity of purified parasite and human 20S
proteasomes was monitored by measuring cleavage of various rhodamine-labelled fluorogenic substrates.
Purified 20S proteasomes were diluted in proteasome assay buffer (25 mM Tris-HCl pH 7.5, 1 mM
dithiothreitol (Sigma-Aldrich), 10 mM sodium chloride, 25 mM potassium chloride, 1 mM magnesium
chloride, 0.05% (w/v) CHAPS (Sigma-Aldrich) and 0.9% DMSO) at a final concentration of 162 nM
(parasite proteasomes) or 25 nM (human proteasome), and pre-incubated with compound (40 nL; 0.2%
final DMSO concentration) for 1 hour. Next, the following substrates (Biosynthan GmbH) were added at

612 3 μM final concentration to monitor specific proteolytic activities (Suc-LLVY-Rh110-dPro:

613 chymotrypsin-like activity; Ac-RLR-Rh110-dPro: trypsin-like activity; Ac-GPLD-Rh110-dPro: caspase-

614 like activity). The reaction was allowed to proceed for two hours at room temperature and fluorescence as

a measure of purified 20S proteasome activity was monitored using the EnVision® plate reader

616 (excitation at 485 nm/ emission at 535 nm). Km and Ki values were calculated using GraphPad Prism

617 (GraphPad Software) 'Non-competitive enzyme inhibition' function.

Data shown in Fig. 4a, 4c, 4d and Extended Data Table 3 represent means of 3 technical replicates (n= 3).

Data shown in Fig. 4b and Extended Data Fig. 5 represent means of 2 technical replicates (n=2).

620 Monitoring accumulation of ubiquitylated proteins in intact cells. Growing *T. cruzi* epimastigotes

621 were seeded into 24-well tissue culture plate (1 x 10^7 cells/per well) in LIT medium and treated for 2-12

hours with DMSO (0.2%) or various concentrations of bortezomib and GNF6702 at 27 °C. Following the

treatment, parasites were collected by centrifugation (3,500 g for 6 minutes) and washed twice with

624 phosphate-buffered saline (PBS). Epimastigotes were lysed by resuspending washed cells in a buffer

625 containing 50 mM Tris-HCl pH= 7.4, 150 mM sodium chloride, 1% CHAPS, 20 μM E-64 (Sigma-

Aldrich), 10 mM EDTA(Sigma-Aldrich), 5 mM N-ethylmaleimide(Sigma-Aldrich), 1 mM

627 phenylmethylsulfonyl fluoride (Sigma-Aldrich), 10 μg/mL leupeptin (Sigma-Aldrich), 10 μg/mL

aprotinin (Sigma-Aldrich), and incubating the suspension on ice for 20 minutes. Cell lysates were cleared

by centrifugation at 21,000 g for 30 min at $4 \,^{\circ}$ C.

For 3T3 cells, 2×10^5 cells/ well were seeded into 24-well tissue culture plates in RPMI medium 1640

631 supplemented with 10% heat-inactivated fetal bovine serum, and incubated overnight at 37 °C to allow

cells to attach. Attached cells were treated for 2 hours with DMSO (0.25%) or various concentrations of

bortezomib and GNF6702. Treated cells were washed twice with PBS and then lysed by incubating cells

634 in modified RIPA buffer (50 mM Tris-HCl pH= 7.4, 1% Triton X-100, 0.2% sodium dodecylsulfate, 1

635 mM EDTA, 1 mM phenylmethylsulfonyl fluoride, 5 μ g/mL aprotinin, 5 μ g/mL leupeptin) for 30 min at 636 4 °C. Cell lysates were cleared by centrifugation at 21,000 g for 30 min at 4 °C.

Protein concentration in cell extracts was determined with BCA assay (ThermoFisher), and 10 µg of cell 637 638 extracts were loaded on NuPAGE Novex 4-12% Bis-Tris gel (Invitrogen). After electrophoresis, resolved proteins were transferred to nitrocellulose membrane. Ubiquitylated proteins were detected with 639 polyclonal anti-ubiquitin primary antibody (Proteintech, catalogue number 10201-2-AP) and rabbit anti-640 mouse IgG-peroxidase antibody (Sigma-Aldrich, catalogue number A0545), and then imaged using ECL 641 Prime Western Blotting Detection Reagent (Amersham) on Chemidoc XR+ imaging system (BioRad). 642 643 Collected western blot images were quantified using Image Lab software (BioRad). Briefly, rectangles of 644 identical size and shape were drawn around each blot lane to include inside the shape all ubiquitylated protein bands within 17 - 198 kDa molecular mass range. Next, integrated signal intensities within the 645 rectangles (reported by the Image Lab software) were used for calculation of EC_{50} values. Three 646 647 technical replicate experiments (n=3) for each different dose response experiment (GNF6702 on T. cruzi epimastigotes; GNF6702 on 3T3 cells; bortezomib on *T. cruzi* epimastigotes; bortezomib on 3T3 cells) 648 649 were performed.

Trypanosoma cruzi proteasome modeling studies. The homology model of *T. cruzi* 20S proteasome was built using 'Prime' protein structure prediction program (Schrödinger) and X-ray structure of bovine 20S proteasome (pdb accession code 1IRU)³⁹ as the template. The model was subjected to restrained minimization to relieve inter-chain clashes. 'SiteMap' program (Schrödinger) was used to identify pockets on a protein surface suitable for small molecule binding. Flexible ligand docking was performed using 'Glide 5.8' (Schrödinger). The grid box was centered in a middle of the identified pocket and extended by 10 Å, with outer box extending additional 20Å. The ligand was docked using the standard

precision (SP) algorithm and scored using 'GlideScore' (Schrödinger). The GNF6702 GlideScore is
equal to -8.5.

Receptor, enzyme and ion channel assays. GNF6702 profiling was performed at 10 μ M concentration in a selectivity panel at Eurofins (www.eurofinspanlabs.com/Catalog/AssayCatalog/AssayCatalog.aspx). Listed values % change in the assay readout relative to the DMSO control. To determine inhibition of a subset of human tyrosine kinases by GNF6702, the inhibitor was profiled on a panel of Ba/F3 cell lines expressing individual Tel-activated kinases as described previously⁴⁰. All assays were performed as single technical repeats.

Determination of GNF6702 thermodynamic solubility. The solubility of GNF6702 was assessed in a 665 high throughput thermodynamic solubility assay as described previously⁴¹. First, 25 µL of GNF6702 666 DMSO solutions were transferred to individual wells of a 96-well plate. DMSO was evaporated and 250 667 668 μ L of 67 mM potassium phosphate buffer pH 6.8 were added to yield projected final compound concentrations from 1 μ M to 100 μ M. The plate was sealed to prevent solvent loss and shaken for 24 669 hours at room temperature. The plate was then filtered to remove non-dissolved material. Concentration 670 671 of GNF6702 in individual plate wells was determined by measuring solution UV absorbance with reference to a GNF6702 calibration curve. 672

673 Determination of GNF6702 permeability in Caco-2 assay. A 96-Multiwell Insert System (BD

Biosciences) was used for the Caco-2 cell culture and permeability assay as described previously⁴². Caco-2 cells were seeded onto insert wells at a density of 1.48×10^5 cells per ml and allowed to grow for 19-23 days before assays. To measure both absorptive (apical to basolateral [A-B]) and secretory (basolateral to apical [B-A]) compound transport, a solution of GNF6702 at 10 µM concentration in 0.5% DMSO were added to donor wells. The plate was incubated at 37°C for 2 hours, with samples taken at the beginning

- and end of the incubation from both donor and acceptor wells. The concentration of GNF6702 wasdetermined by LC-MS/MS.
- 681 Apparent drug permeability (Papp) was calculated using the following equation:
- 682 Papp = dQ/dt * 1/(A*Cin)
- dQ/dt is the total amount of a test compound transported to the acceptor chamber per unit of time
- (nmol/s), A is the surface area of the transport membrane (0.0804 cm²), Cin is the initial compound
- 685 concentration in the donor chamber (10 μ M), and Papp is expressed as cm/s).

686 **Determination of human CYP450 inhibition by GNF6702.** Extent of inhibition of major human

- 687 CYP450 isoforms 2C9, 2D6 and 3A4 by GNF6702 was determined using pooled human liver
- microsomes and the known specific substrates of various CYP450 isoforms: diclofenac (5 μ M), bufuralol
- $(5 \,\mu\text{M})$, midazolam (5 μ M), and testosterone (50 μ M). Probe substrate concentrations were used at
- 690 concentrations equal to their reported Km values. The CYP450 inhibition assays with probe substrates
- diclofenac (2C9) or midazolam (3A4) were incubated at 37 °C for 5 to 10 minutes using a microsomal
- 692 protein concentration of 0.05 mg/mL. Probe substrates bufuralol (2D6) and testosterone (3A4) were
- 693 incubated at 37 °C for 20 minutes using microsomal concentration 0.5 mg/mL. The test concentrations of
- 694 GNF6702 ranged from 0.5 to 25 μ M in the presence of 1% DMSO. The reactions were initiated by
- adding NADPH (1 mM final concentration; Sigma-Aldrich) after a 5-min pre-incubation. Incubations
- 696 were terminated by the addition of $300 \,\mu\text{L}$ of acetonitrile to $100 \,\mu\text{L}$ of a sample. No significant
- 697 cytochrome P450 inhibition was observed. Extent of CYP450 isoform inhibition was determined by
- 698 quantifying residual concentrations of individual CYP450 substrate probes at the end of reactions by
- 699 LC/MS/MS.
- Determination of GNF6702 *in vitro* metabolic stability. The intrinsic metabolic stability of GNF6702
 was determined in mouse and human liver microsomes using the compound depletion approach and

- LC/MS/MS quantification. The assay measured the rate and extent of metabolism of GNF6702 by
- measuring the disappearance of the compound. The assay determined GNF6702 *in vitro* half-life $(T^{1}/_{2})$
- and hepatic extraction ratios (ER) as described previously⁴³. GNF6702 was incubated for 30 minutes at
- $1.0 \,\mu\text{M}$ concentration in a buffer containing $1.0 \,\text{mg/mL}$ liver microsomes. Samples (50 μL) were
- collected at 0, 5, 15 and 30 minutes and immediately quenched by addition of $150 \,\mu$ L of ice-cold
- acetonitrile/ methanol/water mixture (8/1/1). Quantification of GNF6702 in samples was performed by
- 708 LC/MS/MS, and the *in vitro* intrinsic clearance was determined using the substrate depletion method.
- 709 The intrinsic clearance, CLint was calculated using the following equation:
- 710 CLint = $(0.693/T^{1}/_{2}) * (V/M)$,
- where $T^{1/2}$ is the *in vitro* half-life, V (µL) is the reaction volume, and M (mg) is the microsomal protein amount. Finally the hepatic extraction ratio is calculated as:
- 713 ER = CLh/Qh,
- where CLh = hepatic clearance, Qh = hepatic blood flow.
- 715 Clh was calculated using the following equation:
- 716 CLh = (Qh * fu * CLint)/(Qh + fu * CLint),
- where fu = fraction unbound to protein (assumed to be 1).

718 Pharmacokinetic studies. An outline of various *in vitro* and *in vivo* DMPK assays used in this study for

- compound profiling was summarized previously⁴⁴. The pharmacokinetic properties of GNF compounds
- and calculation of pharmacokinetic parameters was performed as described previously²³. Mean
- 721 compound plasma concentrations were calculated from fitted functions approximating compound plasma
- 722 profile throughout 8 days of dosing. Blinding was not possible in these experiments.
- 723 Bioanalysis of GNF6702 in plasma. Plasma concentration of GNF6702 was quantified using a
- 724 LC/MS/MS assay. Solution of 20 ng/mL of verapamil hydrochloride (Sigma-Aldrich) in

725 acetonitrile/methanol mixture (3/1 by volume), was used as an internal standard. Twenty microliters of 726 plasma samples were mixed with 200 µl of internal standard solution. The samples were vortexed and then centrifuged in an Eppendorf Centrifuge 5810R (Eppendorf) at 4,000 rpm for 5 minutes at 4 °C to 727 728 remove precipitated plasma proteins. The supernatants (150 µl) were transferred to a 96-well plate and 729 mixed with 150 µl H₂O. The samples (10 µl) were then injected onto a Zorbax SB-C8 analytical column (2.1 x 30 mm, 3.5 µm; Agilent Technologies) and separated using a three step gradient (1st step: 1.5 mL 730 of 0.05% formic acid in 10% acetonitrile; 2nd step: 0.5 mL of 0.05% formic acid in 100% acetonitrile; 3rd 731 step: 0.5 mL of 0.05% formic acid in 10% acetonitrile) at flow rate of 700 µl/min. GNF6702 and 732 verapamil were eluted at retention time 1.19 and 1.17 minutes, respectively. The HPLC system, 733 consisting of Agilent 1260 series binary pump (Agilent Technologies), Agilent 1260 series micro 734 vacuum degasser (Agilent Technologies) and CTC PAL-HTC-xt analytics autosampler (LEAP 735 736 Technologies) was interfaced to a SCIEX API 4000 triple quadrupole mass spectrometer (Sciex). Mass 737 spectrometry analysis was carried out using atmospheric pressure chemical ionization (APCI) in the positive ion mode. GNF6702 (430.07 > 333.20) and verapamil (455.16 > 164.90) peak integrations were 738 739 performed using AnalystTM 1.5 software (Sciex). The lower limit of quantification (LLOQ) in plasma was 1.0 ng/mL. Samples were quantified using seven calibration standards (dynamic range 1 - 5,000740 ng/mL) prepared in plasma and processed as described above. 741

Formulation of study drugs for *in vivo* efficacy experiments. All compounds administered to mice
during efficacy experiments were formulated as suspensions in distilled water containing 0.5%
methylcellulose (Sigma-Aldrich) and 0.5% Tween 80 (Sigma-Aldrich). During a treatment course, each
mouse received 0.2 ml of drug suspension per dose by oral gavage.

Mouse model of visceral leishmaniasis. Female BALB/c mice (Envigo; 6-8 weeks old) were infected by tail vein injection with $4 \ge 10^7 L$. *donovani* MHOM/ET/67/HU3 splenic amastigotes (protocol number

748 P11-319). Seven days after infection, animals were orally dosed for eight days with vehicle (0.5% 749 methylcellulose/0.5% Tween 80, miltefosine (12 mg/kg once-daily; Sigma-Aldrich), or a GNF compound (twice-daily). On the first day of dosing, three mice were used for collection of blood for PK 750 751 determination and euthanized afterwards. On the last day of dosing, PK samples were collected from 752 remaining five mice, which were also used for determination of compound efficacy (n= 5 mice per group). Liver samples were collected from these five mice and *L. donovani* parasite burdens were 753 754 quantified by qPCR as follows. Total DNA was extracted from drug-treated mice livers using the DNeasy Blood and Tissue Kit (Qiagen). Two types of DNA were quantified in parallel using the 755 TaqMan assay: L. donovani major surface glycoprotein gp63 (Ldon GP63) and mouse GAPDH. L. 756 757 donovani GP63 DNA was quantified with the following set of primers: TGCGGTTTATCCTCTAGCGATAT (forward), AGTCCATGAAGGCGGAGATG (reverse), and 758 759 TGGCAGTACTTCACGGAC (TaqMan MGB probe, 5'-FAM-labeled reporter dye, non-fluorescent 760 quencher). Mouse GAPDH DNA was quantified with the following set of primers: 761 GCCGCCATGTTGCAAAC (forward primer), CGAGAGGAATGAGGTTAGTCACAA (reverse 762 primer), and ATGAATGAACCGCCGTTAT (TaqMan MGB probe, 5'-FAM-labeled reporter dye, nonfluorescent quencher). Each qPCR reaction (10 µL) included 5 µl of TaqMan Gene Expression Master 763 Mix (Life Technologies), 0.5 µL of a 20X primer/probe mix (Life Technologies), and 4.5 µL (50 ng) of 764 765 total DNA from liver samples. DNA amount was quantified using the Applied Biosystems 7900HT 766 instrument. L. donovani parasite burden (RU: relative units) was expressed as the abundance of L. 767 donovani GP63 DNA relative to the abundance of mouse GAPDH DNA. 768 Mouse footpad model of cutaneous leishmaniasis. L. major MHOM/SA/85/JISH118 metacyclic promastigotes were generated and purified by the peanut agglutinin method as described elsewhere⁴⁵. To 769

establish the *L. major* footpad infection, female BALB/c mice (Envigo; 6-8 weeks old; protocol number

771	P11-319) were injected with suspension of L. major metacyclic promastigotes (1 x 10^6 parasites in 50
772	μ L) into each hind footpad. After eight days of infection, animals were dosed with vehicle, miltefosine
773	(30 mg/kg once-daily), or indicated regimens of GNF6702 for seven days (n=6 mice per group). The
774	progress of infection was monitored by measuring the size (length and thickness) of hind footpad
775	swelling using digital calipers. At the end of the study, the mice were euthanized, and the footpad tissues
776	were extracted and used for genomic DNA isolation with the DNeasy Blood and Tissue kit (Qiagen). The
777	L. major footpad burden was determined by qPCR quantification of kinetoplastid minicircle DNA
778	(forward primer: 5'-TTTTACACCTCCCCAGTTT-3'; reverse primer: 5'-
779	CCCGTTCATAATTTCCCGAAA-3'; Taqman MGB probe: 5'-AGGCCAAAAATGG-3', 5'-FAM [6-
780	carboxyfluorescein]-labeled reporter dye, non-fluorescent quencher). The amounts of mouse
781	chromosomal DNA in extracted samples were quantified in parallel qPCR using a glyceraldehyde-3-
782	phosphate dehydrogenase (GAPDH) TaqMan assay as described for mouse VL model above. L. major
783	burden in footpad was expressed as the ratio of kinetoplast minicircle DNA to mouse GAPDH. P values
784	for the between-groups differences in efficacies were calculated with a Student's paired t test with a two-
785	tailed distribution.
786	Mouse model of Chagas disease. Compound efficacy in mouse model of Chagas disease was
787	determined as described previously ²³ . Female C57BL/6 mice (Envigo; 6-8 weeks old; protocol number
788	P11-316) were infected by intraperitoneal injection with 10 ³ tissue culture-derived <i>T. cruzi</i> CL
789	trypomastigotes. Starting at 35 days after infection, the animals were dosed orally once-daily with 100
790	mg/kg benznidazole (Sigma-Aldrich) and indicated doses of GNF6702 (1, 3, and 10 mg/kg twice-daily,
791	n=8 per group) for 20 days. Ten days following the end of drug treatment, the mice underwent four
792	cycles of cyclophosphamide immunosuppression, each cycle lasting one week. During each
793	immunosuppression cycle, mice were dosed by oral gavage once-daily with 200 mg/kg

794 cyclophosphamide (suspension in 0.5% methylcellulose/ 0.5% Tween80 aqueous solution) on day 1 and 795 day 4 of the cycle. After the fourth immunosuppression cycle, blood samples were collected from the 796 orbital venous sinus of each mouse, mice were euthanized and heart and colon samples were collected. 797 Samples from treated mice were used for extraction of total DNA using the High Pure PCR template 798 preparation kit (Roche). The amounts of T. cruzi satellite DNA (195-bp fragment) in extracted DNA samples were quantified by real-time qPCR TaqMan assay (Life Technologies) with the following set of 799 800 primers: AATTATGAATGGCGGGGAGTCA (forward primer), CCAGTGTGTGAACACGCAAAC (reverse primer), and AGACACTCTCTTTCAATGTA (TagMan MGB probe, 5'-FAM [6-801 carboxyfluorescein]-labeled reporter dye, non-fluorescent quencher). The amounts of mouse 802 chromosomal DNA in extracted samples were quantified in parallel qPCR reactions using a GADPH 803 (glyceraldehyde-3-phosphate dehydrogenase) TaqMan assay as described for mouse VL model above. 804 805 Each qPCR mixture (10 μ l) included 5 μ l of TaqMan Gene Expression master mix (Life Technologies), 806 $0.5 \,\mu$ l of a 20x primer/ probe mix (Life Technologies), and 4.5 μ l (50 ng) of total DNA extracted from blood samples. PCRs were run on the Applied Biosystems 7900HT instrument. T. cruzi parasitemia was 807 808 expressed as the abundance of T. cruzi microsatellite DNA relative to the abundance of mouse GAPDH DNA. 809 Mouse model of stage II HAT. Female CD1 (Charles River UK; ~8 weeks old; protocol number PPL 810

811 60/4442) mice were infected by injection into the peritoneum with 3 x 10^4 *T. brucei* (GVR35-VSL2)

812 bloodstream form parasites⁴⁶. Starting on day 21, mice were dosed by oral gavage once-daily with

813 GNF6702 (n= 6) at 100 mg/kg for 7 days or a single dose of diminazene aceturate (Sigma-Aldrich) at 40

mg/kg in sterile water was administered by ip injection (n=3). A group of untreated mice (n=3) was

815 included as controls.

816	Mice were monitored weekly for parasitemia from day 21 post-infection. T. brucei was quantified in
817	blood samples from the tail vein by microscopy, and in vivo bioluminescence imaging of infected mice
818	was performed before treatment on day 21 post-infection and in weeks following the treatment (day 28,
819	35, 42, 56, 63, 72, 84, 92 post-infection). Imaging on groups of three mice was performed 10 min after ip
820	injection of 150 mg D-luciferin (Promega)/kg body weight (in PBS) using an IVIS Spectrum
821	(PerkinElmer) as described previously ²⁵ . A group of uninfected mice (aged-matched for day 0 time point;
822	n= 4) were imaged using the same acquisition settings to show the background bioluminescence (Fig. 2e,
823	grey-filled squares) in the absence of luciferase-expressing T. brucei after day 92 of the experiment.
824	Untreated and diminazene-treated mice were euthanized on days 32 and 35, and day 42, respectively, due
825	to high parasitemia or the development of symptoms related to CNS infection. GNF6702-treated mice
826	were euthanized on day 92. No parasitemia or clinical symptoms were observed at this point. At the
827	specified endpoints mice were sacrificed by cervical dislocation, after which whole brains were removed
828	and imaged <i>ex vivo</i> within 10 minutes after administration of 100 μ L of D-luciferin onto the brain
829	surface. Data analysis for bioluminescence imaging was performed using Living Image Software. The
830	same rectangular region of interest (ROI) covering the mouse body was used for each whole body image
831	to show the bioluminescence in total flux (photons per second) within that region. Image panels of whole
832	mouse bodies are composites of the original images with areas outside the ROI cropped out to save
833	space. For ex vivo brain images the same oval shaped ROI was used to display the bioluminescence
834	detected for each mouse brain at the respective endpoints.

835 Chemical synthesis. The detailed procedures for chemical synthesis are presented in Supplementary836 Information.

837 END NOTES

838 **Supplementary Information** can be found at the end of this manuscript.

- 840 (091038/Z/09/Z to R.J.G. and F.S., and 104976/Z/14/Z, 104111/15/Z to J.C.M. and E.M.) and NIH
- 841 (AI106850 to F.S.B.). We thank Simon Croft, Rob Don, Lars Gredsted, Alan Hudson and John Mendlein
- for discussions, Rick Tarleton for *T. cruzi* CL strain, and George Cross for *T.b. brucei* Lister 427 strain.
- 843 We thank Andreas Kreusch for help with proteasome purification, and Fabio Luna for help with *T. cruzi*
- 844 whole genome sequencing. We acknowledge technical assistance of Omeed Faghih in generating the
- plasmids for ectopic expression of *PSMB4* in *T. cruzi*, Ryan Ritchie for IVIS *in vivo* imaging, and Annie
- 846 Mak, Jason Matzen and Paul Anderson for execution of high throughput screens. We thank John Isbell
- and Thomas Hollenbeck for profiling GNF6702 in ADME assays.

848 **Contributions**

- A.B., F.L., C.J.N.M., P.K.M., A.S.N., J.L.T. and V.Y. designed chemical analogues, and performed
- chemical synthesis and purification of synthesized analogues. F.S.B., J.B., J.R.G., S.K., H.X.Y.K.,
- 851 Y.H.L., S.P.S.R., F.S., and X.L. conducted and analyzed data from *in vitro* growth inhibition assays.
- L.C.D., X.L., J.C.M., E.M., I.C.R., S.P.S.R., M.S., F.S., and B.G.W. conducted and analyzed data from
- 853 *in vivo* efficacy assays. J.B., M.-Y.G., S.K., and F.S. conducted proteasome purification, proteasome
- inhibition assays and biochemical data analysis. S.W.B., G.F., S.K., F.S., and J.R.W. designed, conducted
- and analyzed experiments resulting in identification of proteasome resistance mutations. G.S. and B.B.
- built the homology model of *T. cruzi* proteasome structure and performed GNF6702 docking. A.B. and
- J.D.V. analyzed *T. cruzi* proteasome by mass spectrometry. A.N., T.G., M.S., F.S., and T.T. designed,
- conducted, and analyzed PK data. A.N. and V.M. led the chemistry team. F.S. led the biology team.
- 859 R.J.G. and F.S. supervised and led the overall project, and led the writing of the manuscript. All authors
- 860 contributed to writing of the manuscript.

876 EXTENDED DATA LEGENDS

877 Extended Data Figure 1: Pharmacokinetic profile of GNF6702 in mouse. a, Time profiles of mean

free plasma concentration of GNF6702 in mouse model of visceral leishmaniasis; free GNF6702

concentration values were predicted from measured total plasma concentration values collected on day 1

and day 8 of treatment. Dashed blue lines correspond to intra-macrophage *L. donovani* EC₅₀ of 18 ± 1.8

- nM and EC₉₉ of 42 ± 5.6 nM. Circles: means \pm s.d.; n=3 mice for treatment day 1; n=5 mice for treatment
- day 8; fraction unbound in mouse plasma=0.063. For data points lacking error bars, standard deviations
- are smaller than circles representing means. **b**, Time course of total GNF6702 concentration in mouse
- plasma and brain after single oral dose (20 mg/kg); n=2 mice per time point; circles: measured values;
- 885 rectangles: means.

886 Extended Data Figure 2: GNF6702 clears parasites from mice infected with T. brucei. a, In vivo quantification of bioluminescent T. brucei in infected mice before and after treatment. ip: intraperitoneal; 887 day 21: start of treatment; day 28: 24 hours after last GNF6702 dose; day 42: evaluation of early parasite 888 889 recrudescence in mice treated with diminazene aceturate (n=3); day 42 and 92: absence of parasite recrudescence in mice treated with GNF6702 (n=6). Images from uninfected mice (3 mice of 4 are shown) 890 891 aged-matched for day 0 were collected independently using the same acquisition settings. Parasitemia 892 (blue font) and whole mouse total flux (black font) values of each animal are shown above the image; N.D.: not detectable. Within each group the mouse numbers in yellow (top left in each image) refer to the 893 894 same mouse imaged throughout. Complete sets of parasitemia and whole mouse total flux values collected on individual mice throughout the experiment are listed in Supplementary Tables 4 and 5. b, 895 Brains from mice shown in panel a were soaked in luciferin and imaged for presence of bioluminescent T. 896 897 *brucei* at the indicated time points. For three diminazene-treated mice, two images of each brain are shown, one at a lower sensitivity (left) and the other at a high signal intensity scale. 898

899 Extended Data Figure 3: Structures and profiles of GNF3943 and GNF8000 used for selection of

resistant *T. cruzi* **lines**. *L. donovani*: amastigotes proliferating within primary mouse macrophages; *T. brucei*: the bloodstream form trypomastigotes; *T. cruzi*: amastigotes proliferating in 3T3 fibroblast cells; macrophage: mouse primary peritoneal macrophages; EC_{50} and CC_{50} : half-maximum growth inhibition concentration; F: oral bioavailability in mouse after administering single compound dose (20 mg/kg) as a suspension; CL: plasma clearance in mouse after single iv bolus dose (5 mg/kg); all EC_{50} and CC_{50} values correspond to means \pm s.e.m. (n=4 technical replicates).

906 Extended Data Figure 4: Mutations in proteasome beta 4 subunit confer resistance to GNF6702 in

907 *T. cruzi* and *T. brucei*. a, growth curves of wild type, GNF3943-resistant and GNF8000-resistant *T*.

908 *cruzi* epimastigote strains in the presence of increasing concentrations of GNF6702, nifurtimox,

909 bortezomib and MG132; RU (relative units) corresponds to parasite growth relative to the DMSO

910 control (%); for data points lacking error bars, standard errors are smaller than circles representing means;

911 due to limited aqueous solubility, the highest tested GNF6702 concentration was 10 µM. b, growth

912 inhibition EC₅₀ values of GNF6702, bortezomib, MG132 and nifurtimox on indicated *T. cruzi* strains. c,

growth inhibition EC₅₀ values of GNF6702 and bortezomib on *T. cruzi* epimastigotes and *T. brucei*

bloodstream form trypomastigotes overexpressing PSMB4^{WT} or PSMB4^{F24L}. Data shown in panels **a**, **b**

915 and **c** correspond to means \pm s.e.m. (n=3 technical replicates).

916 Extended Data Figure 5: Correlation between inhibition of parasite proteasome chymotrypsin-like

917 activity and parasite growth inhibition by the GNF6702 compound series. IC₅₀: half-maximum

918 inhibition of indicated parasite proteasome; *T. brucei* EC₅₀: half-maximum growth inhibition on *T. brucei*

bloodstream form trypomastigotes; *T. cruzi* EC₅₀: half-maximum growth inhibition on *T. cruzi*

amastigotes proliferating inside 3T3 cells; data points correspond to means of 2 technical replicates; red

921 circles: $IC_{50}>20 \mu M$; yellow circles: $IC_{50}>20 \mu M$ and $EC_{50}>25 \mu M$; data for 317 analogues are shown.

922 Extended Data Figure 6: Hypothetical model of GNF6702 binding to T. cruzi proteasome beta 4

subunit. a, Alignment of amino acid sequences of proteasome beta 4 subunits (PSMB4) from *L*.

924 donovani, T. cruzi, T. brucei and H. sapiens. Green: amino acid residues conserved between human and

825 kinetoplastid PSMB4 proteins; blue: amino acid residues conserved only among kinetoplastid PSMB4

926 proteins; black: amino acids mutated in *T. cruzi* mutants resistant to analogues from the GNF6702 series.

b, Surface representation of the modeled *T. cruzi* 20S proteasome structure showing relative positions of
the beta 5 and beta 4 subunits. Beta 4 amino acid residues F24 and I29 (colored yellow) are located at the
interface of the two beta subunits. GNF6702 is depicted in a sphere representation bound into a predicted
pocket on the beta 4 subunit surface with carbon, nitrogen, oxygen and hydrogen atoms colored magenta,

blue, red and grey, respectively. The other *T. cruzi* 20S proteasome subunits are colored gray. **c**, Close-up

932 of the beta 5 and beta 4 subunits. The beta 5 subunit active site (pocket 1, chymotrypsin-like activity) is 933 colored pale green. The predicted beta 4 pocket (pocket 2) with bound GNF6702 is colored blue. The 934 inhibitor is shown in a stick representation with atoms colored as described in caption for the b panel. 935 Beta 4 residues F24 and I29 are colored yellow. The proteasome model shown in panels b and c was produced by The PyMol Molecule Graphics System, Version 1.8, Schrodinger, LLC. 936

Extended Data Figure 7: Effect of GNF6702 on accumulation of ubiquitylated proteins by T. cruzi 937

epimastigotes and 3T3 cells. a, Western blot analysis of T. cruzi whole cell extracts with anti-ubiquitin 938

antibody after treatment with GNF6702 and bortezomib. **b**, Western blot analysis of 3T3 whole cell 939

940 extracts with anti-ubiquitin antibody after treatment with GNF6702 and borteomib. c, Concentrations of

GNF6702 and bortezomib effecting half-maximum accumulation of ubiquitylated proteins in T. cruzi and

3T3 cells (means \pm s.e.m.; n=3 technical replicates); total ubiquitin signal values in individual blot lanes

943 shown in panels **a** and **b** were quantified and used for calculation of the listed EC_{50} values. In **a** and **b**,

944 numbers above the blot lanes indicate compound concentrations and D indicates control, DMSO-treated cells. For western blot source data, see Supplementary Figure 1. 945

Extended Data Table 1: Point mutations identified by whole genome sequencing in GNF3943- and 946 947 GNF8000-resistant T. cruzi epimastigotes.

Extended Data Table 2: Enzyme inhibition IC₅₀ values of bortezomib and GNF6702 on three 948

proteolytic activities of wild type T. cruzi, PSMB4^{129M} T. cruzi, and H. sapiens proteasomes. 949

Extended Data Table 3: Inhibition kinetics parameters of GNF6702 on L. donovani and T. cruzi 950 951

proteasomes.

941

942

SUPPLEMENTARY METHODS 952

1. Genomics Institute of the Novartis Research Foundation (GNF) chemical library 953

954 The GNF chemical library consists of \sim 3 million low molecular weight compounds.

42

955 2. High throughput screening (HTS) campaigns and hit identification

The high throughput screens were performed using 1,536 well polystyrene solid bottom white
microplates (Greiner Bio-One). The GNF chemical library was tested against *L. donovani*, *T. brucei* and *T. cruzi* in whole-cell growth inhibition screens at single compound concentrations specified in sections
below describing individual parasite screens. Parasite proliferation protocols described in the Methods
section were optimized for 1,536 well plate assay format to provide optimal assay window and Z-factor.
Primary hits included compounds that reduced growth of parasites by more than 50% relative to the
relevant DMSO controls.

963 2.1. Leishmania donovani HTS

Leishmania donovani MHOM/SD/62/1S-CL2D axenic amastigotes in cell suspension were dispensed 964 into 1,536-well assay plates (2,000 parasite cells in 5 µL of medium) and library compounds dissolved in 965 966 DMSO were added to 4 µM final concentration (0.4% final DMSO concentration). After 48 hour incubation at 37 °C, parasite viability was assessed using the CellTiter-Glo Luminescent Cell Viability 967 Assay (Promega) as described previously³². Compounds causing more than 50% reduction in parasite 968 969 viability were considered hits. Identified hits were subsequently evaluated in the screening assay in triplicates at 4 µM compound concentration. Compounds that inhibited L. donovani growth in at least 970 two replicates were considered confirmed hits. 971

972 2.2. Trypanosoma brucei HTS

973 *Trypanosoma brucei* Lister 427 bloodstream trypomastigotes in cell suspension were dispensed into

974 1,536-well assay plates (900 parasite cells in 7 μL of medium) and library compounds dissolved in

975 DMSO were added to 7 μ M final concentration (0.7% final DMSO concentration). After 48 hour

976 incubation at 37 °C, parasite viability was assessed using the CellTiter-Glo Luminescent Cell Viability

977 Assay (Promega) as described previously³². Compounds causing more than 50% reduction in parasite

viability were considered hits. Identified hits were subsequently evaluated in the screening assay in
triplicates at 7 µM compound concentration. Compounds that inhibited *T. brucei* growth in at least two
replicates were considered confirmed hits.

981 2.3. Trypanosoma cruzi HTS

A suspension of mouse fibroblast 3T3 cells was dispensed into 1,536-well assay plates (750 cells in 5 μL

983 of medium). After overnight incubation at 37 °C, adhered 3T3 cells were infected with *T. cruzi*

trypomastigotes (2,500 trypomastigotes per well in 3 µL of medium) and library compounds dissolved in

985 DMSO were added to $6.3 \,\mu$ M final concentration (0.63% final DMSO concentration). After an additional

986 96 hour incubation at 37 °C, parasite viability was assessed using the BetaGlo Luminiscent Assay

987 (Promega) as described previously³². Compounds causing more than 50% reduction in parasite viability

988 were considered hits. Because of a large number of screen hits, we further followed upon only on a small

subset of hits that were also identified as confirmed hits in *L. donovani* and *T. brucei* high throughput

screens. Out of 93 such hits, 77 compounds were confirmed to be selective pan-kinetoplastid inhibitors (L.

991 *donovani*, *T. brucei*, *T. cruzi* EC₅₀ values $< 10 \,\mu$ M, selectivity index relative to 3T3 CC₅₀> 5).

992 **3. Chemical synthesis**

Unless otherwise noted, materials were obtained from commercial suppliers and were used without purification. Removal of solvent under reduced pressure refers to distillation using Büchi rotary evaporator attached to a vacuum pump (~3 mm Hg). Products obtained as solids or high boiling oils were dried under vacuum (~1 mm Hg). Purification of compounds by high pressure liquid chromatography was achieved using a Waters 2487 series with Ultra 120 5 μ m C18Q column with a linear gradient from 10% solvent A (acetonitrile with 0.035% trifluoroacetic acid) in solvent B (water with 0.05% trifluoroacetic acid) to 90% A in four minutes, followed by two and half minute elution with 90% A.

44

¹H NMR spectra were recorded on Bruker XWIN-NMR (400 MHz or 600 MHz). Proton resonances are reported in parts per million (ppm) downfield from tetramethylsilane (TMS). ¹H NMR data are reported as multiplicity (s - singlet, d - doublet, t - triplet, q - quartet, quint - quintet, sept - septet, dd - doublet of doublets, dt - doublet of triplets, bs - broad singlet), number of protons and coupling constant in Hertz. For spectra obtained in CDCl₃, DMSO- d_6 , CD₃OD, the residual protons (7.27, 2.50 and 3.31 ppm respectively) were used as the reference.

Analytical thin-layer chromatography (TLC) was performed on commercial silica plates (Merck 60-F 254, 0.25 mm thickness); compounds were visualized by UV light (254 nm). Flash chromatography was performed either by CombiFlash® (Separation system Sg. 100c, ISCO) or using silica gel (Merck Kieselgel 60, 230-400 mesh). Agilent 1100 series liquid chromatograph/ mass selective detector (LC/ MSD) was used to monitor the progress of reactions and check the purity of products using 254 nm and 220 nm wavelengths, and electrospray ionization (ESI) positive mode. Mass spectra were obtained in ESI positive mode. Elemental analyses were carried out by Midwest microlabs LLC, Indianapolis.

1013 **3.1. Synthesis of GNF5343**

1014 GNF5343 is a commercially available compound and was purchased from Chembridge laboratories1015 (catalogue # 5840200).

1016 3.2. Synthesis of GNF6702; N-(4-fluoro-3-(6-(pyridin-2-yl)-[1,2,4]triazolo[1,5-a]pyrimidin-2-

- 1017 yl)phenyl)-2,4-dimethyloxazole-5-carboxamide
- 1018 **3.2.1. Synthesis of 2-fluoro-5-nitrobenzoyl chloride (1)**

1019 A solution of 2-fluoro-5-nitrobenzoic acid (50 g, 270 mmol) in thionyl chloride (100 mL) was heated to

1020 80 °C and stirred for 4 hours. The mixture was allowed to cool down to room temperature and the solvent

1021 was removed to give compound **1** (54 g, 98% yield).

1022 3.2.2. Synthesis of 2-(2-fluoro-5-nitrobenzoyl)hydrazine-1-carboximidamide (2)

45

1023 To a solution of aminoguanidine carbonate (36.2 g, 266 mmol) in dry toluene (300 mL) at 0 °C, was

added compound **1** (54 g, 0.266 mol) over 30 minutes. The mixture was stirred at room temperature for

1025 12 hours. The formed precipitate was removed by filtration, and the residue was treated with H_2O (400

1026 mL) and made alkaline with sodium carbonate. The solid was collected and recrystallized from water to

1027 obtain compound **2** (62 g, 97% yield). M/Z 241.1 (M+1).

3.2.3. Synthesis of 5-(2-fluoro-5-nitrophenyl)-4H-1,2,4-triazol-3-amine (3)

1029 A solution of compound **2** (62 g, 0.257 mol) in H₂O (800 mL) was stirred for 8 hours at 100 °C. After 1030 cooling, the obtained solid was filtered, and the cake was washed with H₂O (100 mL), tetrahydrofuran 1031 (100 mL), and dried to give compound **3** (34 g, 51% yield). ¹H NMR (400 MHz, DMSO) 12.42 (s, 1H),

1032 8.74 (dd, J = 6.27, 3.01, 1H), 8.26 (dt, J = 8.97, 3.42, 1H), 7.57 (t, J = 9.54, 1H), 6.29 (s, 2H).

1033 **3.2.4.** Synthesis of 2-(2-fluoro-5-nitrophenyl)-6-(pyridin-2-yl)-[1,2,4]triazolo[1,5-a] pyrimidine (4)

1034 To a solution of compound **3** (1 g, 4.48 mmol) in acetic acid (20 mL) 2-(pyridin-2-yl)malonaldehyde (0.8

1035 g, 5.376 mmol) was added at room temperature. The mixture was heated to 100 °C and stirred for 4 hours. 1036 The mixture was allowed to cool to room temperature before adding water (50 mL), filtered, and the filter 1037 cake was washed with saturate sodium bicarbonate solution (100 mL), H₂O (100 mL), and 1038 tetrahydrofuran (100 mL) and dried under vacuum to give compound **4** (0.9 g, 60% yield). ¹H NMR (400 1039 MHz, DMSO) 10.13 (d, J = 2.01, 1H), 9.68 (d, J = 2.01, 1H), 9.09- 9.02 (m, 1H), 8.77 (d, J = 4.27, 1H),

1040 8.28-8.19 (m, 1H), 8.15-7.96 (m, 2 H), 7.77 (t, J = 9.54, 1H), 7.56-7.43 (m, 1H).

1041 3.2.5. Synthesis of 4-fluoro-3-(6-(pyridin-2-yl)-[1,2,4]triazolo[1,5-a]pyrimidin-2-yl)aniline (5)

To a solution of compound 4 (0.15 g, 0.443 mmol) in tetrahydrofuran (5 mL) was added Raney Nickel (0.2 g) and ZnI₂ (71 mg) at room temperature. The mixture was stirred under H₂ (50 psi) at 25 °C for 2.5 hours. The mixture was diluted with methanol (10 mL) and filtered. The solvent was removed and the crude product was washed with methanol (5 mL x 2) and dried under vacuum to give compound **5** (90 mg, 66% yield). ¹H NMR (400 MHz, DMSO) 10.01-10.06 (m, 1H), 9.62-9.58 (m, 1H), 8.73-8.78 (m, 1H), 8.24-8.20 (m, 1H), 8-02-7.96 (m, 1H), 7.57-7.47 (m, 2H), 7.08-7.05 (m, 1H), 6.76-6.70 (m, 1H), 5.24 (s, 2H) M/Z 307.01 (M+1).

3.2.6. Synthesis of N-(4-fluoro-3-(6-(pyridin-2-yl)-[1,2,4]triazolo[1,5-a]pyrimidin-2-yl)phenyl)-2,4dimethyloxazole-5-carboxamide (GNF6702; 6)

- To a solution of 2,4-dimethyloxazole-5-carboxylic acid (40.6 mg, 0.28 mmol) in dimethylformamide (5 1051 mL) was added HATU (118.6 mg, 0.31 mmol) and DIEA (72.4 mg, 0.56 mmol) at room temperature. 1052 The mixture was stirred for 30 min, the intermediate 5 (80 mg, 0.26 mmol) was added at room 1053 temperature. The mixture was stirred for 3 hours, water (10 mL) was added, the mixture was filtered, and 1054 the filter cake was washed with H₂O (5 mL x 2), tetrahydrofuran (5 mL x 2) and purified by HPLC to 1055 give product **6** (33 mg, 31% yield). ¹H NMR (400 M, MeOD) 9.84 (d, J = 2.4, 1H), 9.61 (d, J = 2.3, 1H), 1056 8.76 (dt, J = 4.8, 1.4, 1H), 8.54 (dd, J = 6.4, 2.7, 1H), 8.12 (dt, J = 8.0, 1.1, 1H), 8.00 (td, J = 7.8, 1.8, 1.4, 1H), 8.00 (td, J = 7.8, 1.4, 1H), 8.00 (td, J = 7.8, 1.8, 1.4, 1H), 8.00 (td, J = 7.8, 1.8, 1.4, 1H), 8.00 (td, J = 7.8, 1.4, 1H), 8.00 (td, J = 7.8,1057 1H), 7.93 (ddd, J = 8.9, 4.1, 2.7, 1H), 7.49 (ddd, J = 7.5, 4.9, 1.0, 1H), 7.34 (dd, J = 10.4, 9.0, 1H), 2.57 1058 (s, 3H), 2.48 (s, 3H). M/Z = 430.13 (M+1).1059
- 1060 **3.3.** Synthesis of GNF3943; Isopropyl (2-(2-chloro-5-(furan-2-carboxamido)phenyl)-1H-1061 imidazo[4,5-b]pyridin-6-yl)carbamate

1062 **3.3.1.** Synthesis of 2-chloro-5-(furan-2-carboxamido)benzoic acid (7)

To a suspension of 5-amino-2-chlorobenzoic acid (13.7 g, 79.85 mmol, 1.00 equiv) in tetrahydrofuran (100 mL) was added furan-2-carbonyl chloride (11.5 g, 88.10 mmol, 1.10 equiv) at 0 °C. The ice bath was then removed and the reaction was stirred overnight at room temperature. The resulting mixture was concentrated under vacuum and diluted with DCM. The solid was collected by filtration to give 17 g (80%) of 2-chloro-5-(furan-2-amido)benzoic acid (7) as a gray solid.

1068 **3.3.2.** Synthesis of *N*-(4-chloro-3-[6-nitro-1*H*-imidazo[4,5-b]pyridin-2-yl]phenyl)furan-2-

1069 carboxamide (8)

- 1070 A mixture of 5-nitropyridine-2,3-diamine (6 g, 38.93 mmol, 1.00 equiv) and 2-chloro-5-(furan-2-1071 amido)benzoic acid (7) (10.4 g, 39.15 mmol, 1.00 equiv) in polyphosphoric acid (PPA) (100 mL) was 1072 stirred overnight at 130 °C. The reaction was then poured into water/ice and the pH value of the mixture 1073 was adjusted to 9 with sodium carbonate. The solids were collected by filtration and applied onto a silica 1074 gel column with ethyl acetate/petroleum ether (3/1) to give 3.9 g (26%) of *N*-(4-chloro-3-[6-nitro-1*H*-1075 imidazo[4,5-*b*]pyridin-2-yl]phenyl)furan-2-carboxamide (**8**) as a light yellow solid. ¹H NMR (400 MHz,
- 1076 DMSO) δ 10.50 (s, 1H), 9.19 (d, J = 2.6 Hz, 1H), 8.73 (s, 1H), 8.43 (d, J = 2.6 Hz, 1H), 8.03 7.90 (m,
- 1077 4H), 7.61 (d, J = 8.9 Hz, 1H), 7.41 (d, J = 3.6 Hz, 1H), 6.79 6.67 (m, 1H). MS m/z 383.9 (M+H)⁺.

1078 3.3.3. Synthesis N-(3-[6-amino-1H-imidazo[4,5-b]pyridin-2-yl]-4-chlorophenyl)furan-2-

- 1079 carboxamide (9)
- 1080 To a suspension of *N*-(4-chloro-3-[6-nitro-1*H*-imidazo[4,5-*b*]pyridin-2-yl]phenyl)furan-2-carboxamide
- 1081 (3.9 g, 10.16 mmol, 1.00 equiv) in ethanol (50 mL) was added SnCl₂·2H₂O (3.4 g, 15.04 mmol, 1.48
- 1082 equiv) and the resulting mixture was heated to reflux overnight. The reaction mixture was concentrated
- 1083 under vacuum and diluted with H₂O. The pH value of the mixture was adjusted to 9 with saturated
- sodium carbonate. The solids were collected by filtration and applied onto a silica gel column with ethyl
- 1085 acetate/PE (3/1) to give 1.95 g (54%) of *N*-(3-[6-amino-1*H*-imidazo[4,5-b]pyridin-2-yl]-4-
- 1086 chlorophenyl)furan-2-carboxamide (9) as a yellow solid. ¹H-NMR: (CD₃OD, 400 MHz): 8.16 (d, J = 2.4
- 1087 Hz, 1H), 7.97-8.10 (m, 2H), 7.78 (d, *J* = 0.8 Hz, 1H), 7.65 (d, *J* = 20.0 Hz, 1H), 7.31-7.41 (m, 2H), 6.68
- 1088 (dd, J = 3.6, 2.0 Hz, 1H. MS (M+H)⁺=354.
- 1089 3.3.4. Synthesis of Isopropyl (2-(2-chloro-5-(furan-2-carboxamido)phenyl)-1H-imidazo[4,5-
- 1090 b]pyridin-6-yl)carbamate (GNF3943) (10)

1091 To a 20 mL vial was transferred N-(3-(6-amino-1H-imidazo[4,5-b]pyridin-2-yl)-4-chlorophenyl)furan-2-1092 carboxamide 9 (80 mg, 0.225 mmol) in dimethylformamide (4 mL) followed by addition of pyridine (2 drops), and the reaction mixture was stirred at 0 °C for 10 minutes. At this point was added isopropyl 1093 1094 carbonochloridate (1 M solution in toluene, 1.45 mmols, 6.4 eq). The reaction mixture was stirred overnight while slowly warming up to room temperature. The presence of desired peak (M+H (440)) 1095 1096 was confirmed by LC/MS. The reaction mixture was then quenched with saturated sodium carbonate 1097 solution to neutralize the extra acid chloride and to make the solution basic (pH 8-9). The reaction was extracted with ethyl acetate (3x10 mL), and the resulting organics were dried over sodium sulfate, 1098 1099 filtered, and dried under vacuum. The resulting residue was purified via ISCO column chromatography using (0-100% ethyl acetate/hexane) to provide 53 mg, 0.119 mmol, 53% of the desired compound. ¹H 1100 NMR (400 MHz, MeOD) δ 8.28 (d, J = 22.1, 2H), 8.10 (s, 1H), 7.88 (s, 1H), 7.67 (d, J = 1.0, 1H), 7.51 1101 1102 (d, J = 8.8, 1H), 7.24 - 7.16 (m, 1H), 6.56 (dd, J = 1.7, 3.5, 1H), 4.91 (dt, J = 6.2, 12.5, 1H), 1.24 (d, J = 6.2, 12.5, 1H)6.2, 6H). M/Z=440.1(M+1) 1103

1104 3.4. Synthesis of GNF8000; isopropyl (2-(2-fluoro-5-(furan-2-carboxamido)phenyl) imidazo[1,2-

1105 **a]pyrimidin-6-yl)carbamate**

1106 **3.4.1.** Synthesis of 1-(2-fluoro-5-nitrophenyl)ethan-1-one (11)

A 3,000 mL three necked flask equipped with a mechanic stirrer was charged with concentrated H_2SO_4 (720 mL) and cooled to -40 °C. 1-(2-fluorophenyl)ethanone (180 g, 1.3 mol) was added, followed by addition of a mixture of fuming HNO₃ (106.2 mL) in concentrated H_2SO_4 (260 mL) dropwise over 45 minutes. This mixture was stirred at this temperature for 15 minutes, poured into ice (8 kg), and extracted with ethyl acetate (2000 mL x 2). The combined ethyl acetate layer was washed with saturated NaHCO₃ solution (800 mL x 3), brine (800 mL), dried with anhydrous sodium sulfate, and concentrated under vacuum. The residue was crystallized with petroleum ether to give compound **11** (200 g, yield: 84%) as a 1114 yellow solid. ¹H NMR (400 MHz, CDCl₃) δ 7.34 (t, J = 9.29 Hz, 1H), 8.33-8.48 (m, 1H), 8.78 (dd, J =
1115 6.15, 2.89 Hz, 1H).

1116 **3.4.2.** Synthesis of 2-bromo-1-(2-fluoro-5-nitrophenyl)ethan-1-one (12)

To a solution of compound 11 (126 g, 0.688 mol) in acetic acid (860 mL) and 40% HBr solution (825.6 1117 mL) at 0 °C, was added a solution of Br₂ (110 g, 0.688 mol) in acetic acid (344 mL) in one portion. This 1118 1119 mixture was stirred at room temperature overnight, diluted with water (3000 mL), and extracted with 50% ethyl acetate/petroleum ether (1500 mL x 2). The combined organic layer was washed with a saturated 1120 NaHCO₃ solution (1000 mL x 2), brine (1000 mL), dried with anhydrous sodium sulfate and 1121 concentrated. The residue was purified by column chromatography on silica gel (20% EA/PE) to give the 1122 compound 12 (150 g, yield: 83%) as a white solid.¹H NMR (400 MHz, CDCl₃) δ 8.85 (dd, J = 5.90, 2.89 1123 Hz, 1H), 8.42-8.58 (m, 1H), 7.42 (t, *J* = 9.29 Hz, 1H), 4.52 (d, *J* = 2.01 Hz, 2H). 1124

1125 **3.4.3.** Synthesis of Isopropyl (2-aminopyrimidin-5-yl)carbamate (13)

A suspension of 5-nitropyrimidine-2-amine (1 eq.) and Pd/C (0.05 eq.) in ethanol (0.1 mM) was stirred under hydrogen atmosphere overnight at room temperature to give of 2,5-diaminopyrimidine. The mixture was then filtered and concentrated under vacuum. The residue (1 eq.) was subjected to coupling with isopropylcarbonochloridate (1.5 eq.) in anhydrous pyridine (0.3 mM) overnight at room temperature. The mixture was concentrated under vacuum, and the residue was extracted with ethyl acetate, washed with brine, dried over anhydrous MgSO4 (s), filtered and concentrated under vacuum to give **13** as a yellow solid. m/z (ESI): 196 (M + H⁺).

11333.4.4. Synthesis of isopropyl (2-(2-fluoro-5-nitrophenyl)imidazo[1,2-a]pyrimidin-6-yl)carbamate

1134 **(14)**

1135 Into a 500 mL round-bottom flask, was placed 2-bromo-1-(2-fluoro-5-nitrophenyl)ethan-1-one 12 (30 g,

1136 114.49 mmol, 1 eq.), propan-2-yl N-(2-aminopyrimidin-5-yl)carbamate (11.2 g, 57.08 mmol, 0.5 eq.) and

acetone (200 mL). The resulting solution was stirred overnight at 70 °C. The reaction mixture was cooled
down and the solids were collected by filtration resulting in 15 g (36%) of propan-2-yl N-[2-(2-fluoro-5nitrophenyl)imidazo[1,2-a]pyrimidin-6-yl]carbamate (14) as a brown solid.

1140 3.4.5. Synthesis of isopropyl (2-(5-amino-2-fluorophenyl)imidazo[1,2-a]pyrimidin-6-yl)carbamate

- 1141 (15)
- Into a 1 L round-bottom flask was placed tetrahydrofuran (500 mL), Raney Ni (15 g) and propan-2-yl N-1142 [2-(2-fluoro-5-nitrophenyl)imidazo[1,2-a]pyrimidin-6-yl]carbamate 14 (8 g, 22.26 mmol, 1 eq.). The 1143 resulting solution was stirred overnight at room temperature under an atmosphere of hydrogen. The solids 1144 1145 were filtered out, and washed with methanol (200 mL x 4). The resulting mixture was concentrated under vacuum to give 7 g (95%) of propan-2-yl N-[2-(5-amino-2-fluorophenyl)imidazo[1,2-a]pyrimidin-6-1146 yl]carbamate (I5) as a brown solid. ¹H NMR (400 MHz, DMSO- d_6) δ 9.94 (s, 1H), 9.24 (s, 1H), 8.46-1147 1148 8.47 (m, 1H), 8.26-8.28 (m, 1H), 7.51-7.53 (m, 1H), 6.96-7.02 (m, 1H), 6.55-6.59 (m, 1H), 4.89-4.98 (m, 1H), 3.17 (s, 2H), 1.07-1.30(m, 6H). MS m/z= 330 (M+1). 1149

3.4.6. Synthesis of isopropyl (2-(2-fluoro-5-(furan-2-carboxamido)phenyl) imidazo[1,2-a]pyrimidin6-yl)carbamate (GNF8000) (16)

In a 40 mL vial, pyridine (10 mL) was added to intermediate 15 (0.5 g, 1.518 mmol) to give a yellow 1152 solution. To this solution was added furan-2-carbonyl chloride (0.198 g, 1.518 mmol) at 0 °C and the 1153 resulting mixture was stirred for 1 hour. The reaction mixture was quenched with 60 mL of water and 1154 extracted with ethyl acetate. The same step was repeated once more time to remove any extra pyridine. 1155 All organic phases were combined, dried over sodium sulfate and purified by flash chromatography to 1156 give product **16** (ethyl acetate/methanol= 0-10%). ¹H NMR (400 MHz, DMSO- d_6) δ 10.43 (s, 1H), 10.06 1157 (s, 1H), 9.36 (s, 1H), 8.69 (dd, J = 2.8, 6.9 Hz, 1H), 8.56 (d, J = 2.7 Hz, 1H), 8.45 (d, J = 4.2 Hz, 1H), 1158 8.02 (d, J = 1.0 Hz, 1H), 7.95-7.85 (m, 1H), 7.46 (d, J = 3.4 Hz, 1H), 7.37 (dd, J = 9.0, 10.9 Hz, 1H), 1159

1160 6.78 (dd, J = 1.7, 3.5 Hz, 1H), 5.00 (dt, J = 6.3, 12.5 Hz, 1H), 1.35 (d, J = 6.2 Hz, 6H). MS m/z = 424
1161 (M+1).

- 1162 3.5. Synthesis of GNF3849; N-(4-fluoro-3-(6-phenyl-[1,2,4]triazolo[1,5-a]pyrimidin-2-yl)phenyl)-
- 1163 **2,4-dimethyloxazole-5-carboxamide**
- 1164 **3.5.1.** Synthesis of 2-(2-fluoro-5-nitrophenyl)-6-phenyl-[1,2,4]triazolo[1,5-a]pyrimidine (17)
- 1165 To a solution of compound **3** (0.5 g, 2.24 mmol) in AcOH (5 mL) was added 2-phenylmalonaldehyde
- 1166 (0.39 g, 2.7 mmol). The mixture was then heated to 100 °C and stirred for 4 hours. The mixture was
- allowed to cool to room temperature, water (10 mL) was added, the solids filtered, and the filter cake was
- ¹¹⁶⁸ washed with tetrahydrofuran, and dried under vacuum to give compound **17** (0.36 g, 48% yield). ¹H
- 1169 NMR (400 MHz, DMSO) 9.93 (d, J = 2.4, 1H), 9.38 (d, J = 2.8, 1H), 8.90 (s, 1H), 7.93 (d, J = 7.78, 2H),
- 1170 7.69 (d, *J* = 8.53, 1H), 7.61-7.50 (m, 2H), 7.31 (t, *J* = 7.40, 1H), 6.88 (s, 1H).
- 1171 3.5.2. Synthesis of 4-fluoro-3-(6-phenyl-[1,2,4]triazolo[1,5-a]pyrimidin-2-yl)aniline (18)
- 1172 To a solution of compound 17 (2.5 g, 7.4 mmol) in tetrahydrofuran (200 mL) was added ZnI₂ (1.2 g, 3.7
- 1173 mmol) and Raney Nickel (3.5 g). This mixture was stirred at room temperature for 4 hour under H₂ at 50
- psi, then the mixture was filtrated and washed with methanol (20 mL) to give compound 18 (2.0 g, 87%
- 1175 yield). ¹H NMR (400 MHz, DMSO) 9.81 (d, J = 2.4, 1H), 9.27 (d, J = 2.8, 1H, 7.90 (d, J = 7.6, 2H),
- 1176 7.58-7.53 (m, 2H), 7.45-7.50 (m, 2H), 7.09-7.05 (m, 1H), 6.74-6.70 (m, 1H), 5.22 (s, 2H). M/Z 306.1
- 1177 $(M+H^+)$.

1178 3.5.3. Synthesis of N-(4-fluoro-3-(6-phenyl-[1,2,4]triazolo[1,5-a]pyrimidin-2-yl)phenyl)-2,4-

- 1179 dimethyloxazole-5-carboxamide (GNF3849) (19)
- 1180 To a solution of 2,4-dimethyloxazole-5-carboxylic acid (0.56 g, 3.9 mmol) in dimethylformamide (30 mL)
- 1181 was added DIEA (0.85 g, 6.66 mmol) and HATU (1.5 g, 3.9 mmol). This mixture was stirred at room
- temperature for 30 minutes, then compound **18** (1.0 g, 3.28 mmol) was added. The mixture was then

stirred at room temperature for 4 hours, diluted with water (50 mL) and extracted with tetrahydrofuran/

1184 ethyl acetate (100 mL /50 mL), the organic layer was dried over sodium sulfate and concentrated to give

1185 the crude product. It was purified by HPLC to give product 19 (0.91 g, yield, 65%) as a white solid. ¹H

1186 NMR (400 MHz, MeOD) 9.49 (d, J = 2.4, 1H), 9.22 (d, J = 2.4, 1H), 8.51 (dd, J = 6.4, 2.8, 1H), 7.90

- 1187 (ddd, J = 8.9, 4.2, 2.8, 1H), 7.86-7.76 (m, 2H), 7.63-7.55 (m, 2H), 7.54-7.45 (m, 1H), 7.32 (dd, J = 10.4,
- 1188 9.0, 1H), 2.56 (s, 3H), 2.47 (s, 3H). M/Z= 429.2 (M+H⁺).
- 3.6. Synthesis of GNF2636; isopropyl (2-(2-chloro-5-(furan-2-carboxamido)phenyl)imidazo[1,2a]pyrimidin-6-yl)carbamate

3.6.1. Synthesis of isopropyl (2-(2-chloro-5-nitrophenyl)imidazo[1,2-a]pyrimidin-6-yl)carbamate
(20)

1193 Into a 500-mL round-bottom flask, was placed 13 (1.75 g, 6.3 mmol, 1.2 equiv), acetone (400 mL) and 2-

bromo-1-(2-chloro-5-nitrophenyl)ethan-1-one (1.0 g, 5.3 mmol). The resulting solution was stirred

1195 overnight at 70 °C. The reaction mixture was cooled, the solvent evaporated, the resulting material

suspended in methanol, and then solids collected by filtration resulting in product **20** (0.75 g, 38% yield).

1197 1H NMR (400 MHz, DMSO-D6) δ 10.08 (s, 1H), 9.34 (s, 1H), 9.08 (s, 1H), 8.86 (s, 1H), 8.56 (s, 1H),

 $1198 \qquad 8.19 \ (d, \ J=8.7, \ 1H), \ 7.88 \ (d, \ J=8.8, \ 1H), \ 4.95 \ (m, \ 1H), \ 1.30 \ (m, \ 6H). \ MS \ m/z \ (ESI) = 377 \ (M+).$

3.6.2. Synthesis of isopropyl (2-(5-amino-2-chlorophenyl)imidazo[1,2-a]pyrimidin-6-yl)carbamate (21)

1201 In a round-bottom flask, 20 (300 mg, 0.77 mmol) was taken up in methanol (20 mL) and SnCl2 (3

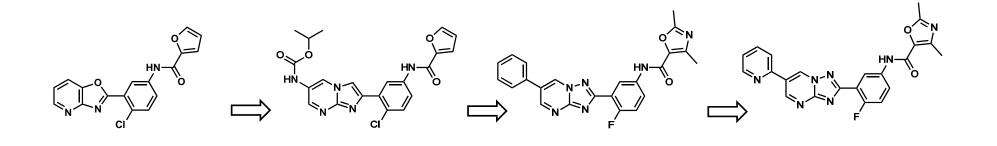

1202 equivalents) was added. The resulting mixture was stirred for 2 hours at reflux. The reaction mixture was

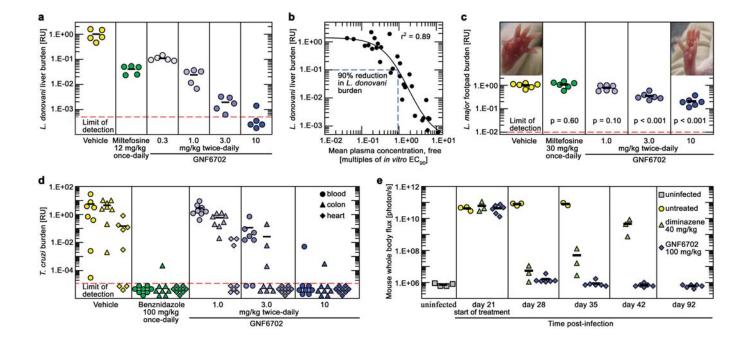

- 1203 concentrated under vacuum and the crude material was purified by flash column chromatography
- 1204 (hexane/ ethyl acetate solvent system followed by DCM/methanol solvent system) resulting in **21** (265
- 1205 mg, 96%) as a yellow solid. 1H-NMR: (300 MHz, MeOD): 9.30 (s, 1H), 8.51 (d, J = 2.1 Hz, 1H), 8.37 (s,

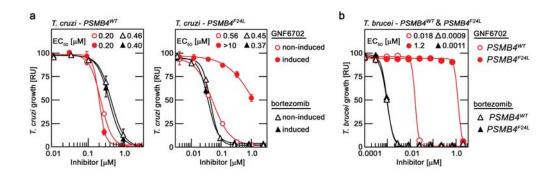

1206 1H), 7.37 (d, J = 1.8 Hz, 1H), 7.23 (d, J = 6.6 Hz, 1H), 6.72-6.74 (m, 1H), 5.01-5.07 (m, 1H), 1.24-1.36
1207 (m, 6H). MS m/z = 346 (M+H+).

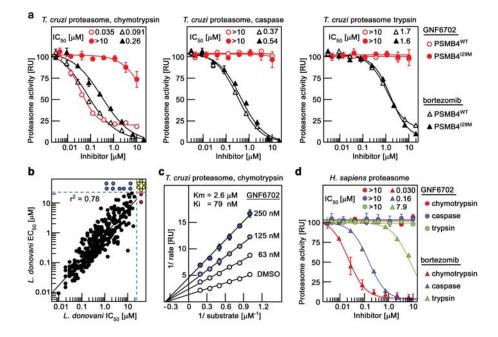

1208 **3.6.3.** Synthesis of isopropyl (2-(2-chloro-5-(furan-2-carboxamido)phenyl)imidazo[1,2-a]

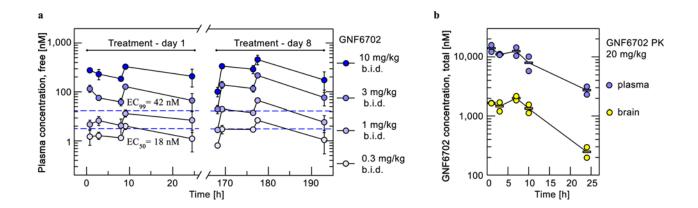

- 1209 pyrimidine-6-yl)carbamate (GNF2636) (22)
- 1210 To a suspension of compound **21** (20 mg, 0.06 mmol) in pyridine (2 mL) in a vial was added 2-furoyl
- 1211 chloride (1.5 equivalents) at room temperature. After stirring overnight, the reaction was concentrated
- and the resulting residue was purified by prep HPLC to afford the product 22 (5 mg, 19% yield). 1H
- 1213 NMR (400 MHz, methanol-d4) δ 9.57 (s, 1H), 8.76 (d, J = 2.6 Hz, 1H), 8.52 (s, 1H), 8.31 (d, J = 2.6 Hz,
- 1214 1H), 7.89 7.69 (m, 2H), 7.62 (d, J = 8.8 Hz, 1H), 7.32 (d, J = 3.5 Hz, 1H), 6.68 (dd, J = 3.5, 1.7 Hz,
- 1215 1H), 5.14 4.97 (m, 1H), 1.35 (d, J = 6.3 Hz, 6H). MS m/z = 440.2 (M+H).

1. Supplementary Table 1

Small molecule screening data from *Leishmania donovani* axenic amastigote growth inhibition HTS.

2. Supplementary Table 2

Small molecule screening data from *Trypanosoma brucei* bloodstream form trypomastigote growth inhibition HTS.

3. Supplementary Table 3

Small molecule screening data from *Trypanosoma cruzi* intracellular trypomastigote growth inhibition HTS.

4. Supplementary Table 4

Time course of parasitemia in mice infected with bioluminescent *T. brucei* during and after treatment with diminazene aceturate and GNF6702

5. Supplementary Table 5

Time course of whole body bioluminescence in mice infected with bioluminescent *T. brucei* during and after treatment with diminazene aceturate and GNF6702

6. Supplementary Table 6

Trypanosoma brucei bioluminescence of *ex vivo* brains obtained from parasite-infected mice after treatment with diminazene aceturate and GNF6702.

7. Supplementary Table 7

20S proteasome subunits identified in purified *T. cruzi* proteasome.

8. Supplementary Table 8

Amino acid sequences of predicted *Trypanosoma cruzi* 20S proteasome alpha and beta subunits.

9. Supplementary Table 9

GNF6702 profile in a panel of mammalian receptors, enzymes and ion channels.

10. Supplementary Table 10

GNF6702 inhibition profile in a cell-based Ba/F3 panel of Tel-activated human tyrosine kinases.

11. Supplementary Table 11

GNF6702 ADME profile.

Supplementary Table 4 – Time course of parasitemia in mice infected with biolumines and GNF6702

N.D.: not detected

ł: euthanized before taking measurement

		Parasitemia [pa						L * 10 ⁵]
