## 69 **Abstract**

70 As guidelines, therapies, and literature on cancer variants expand, the lack of consensus variant  
71 interpretations impedes clinical applications. CIViC is a public domain, crowd-sourced, and  
72 adaptable knowledgebase of evidence for the Clinical Interpretation of Variants in Cancer,  
73 designed to reduce barriers to knowledge sharing and alleviate the variant interpretation  
74 bottleneck.

## 75 **Introduction**

76 The demands of genetics-based clinical decision making in cancer are steadily increasing. For  
77 example, in 2018, NTRK gene fusions became the first cancer variants to receive FDA approval  
78 for targeted therapy irrespective of the type of solid tumor in which they were observed. PubMed  
79 articles mentioning 'NTRK fusions' have increased 10 fold since this approval, reflecting its  
80 dramatic impact on the cancer therapy and research landscape. The FDA's "Novel Drug  
81 Approvals for 2021" list included 16 approvals related to the treatment of cancer, averaging one  
82 new approval approximately every 23 days. The lack of clear and comprehensive cancer variant  
83 interpretations creates a major bottleneck in this process leading to unnecessary delays in  
84 diagnosis and impeding the development of tailored clinical approaches. The timely review of  
85 clinically-relevant biomedical literature remains untenable for individual institutions with entirely  
86 internal (siloes) databases. Yet unlike the fixture of centralized publicly available repositories  
87 such as gnomAD (gnomad.broadinstitute.org) and ClinGen (clinicalgenome.org), that have  
88 become mainstays of germline variant interpretation, the field of somatic cancer variant  
89 interpretation has lagged behind in establishing guidelines, expert panels, and centralized  
90 resources to support clinical applications.

91  
92 CIViC (Clinical Interpretation of Variants in Cancer; [civicdb.org](http://civicdb.org))<sup>1,2</sup> is an open-access, open-  
93 source knowledgebase and curation system for cancer variant interpretation, which leverages  
94 an international team of experts designated as Curators and Editors, collaborating remotely  
95 within a centralized curation interface. Crowdsourced and expert-moderated variant  
96 interpretations are made freely available (public domain CC0 dedication) through web and  
97 application programming interfaces (APIs). CIViC is underlined by six founding principles to  
98 maintain a *freely* and *computationally accessible* resource with *transparency*, an *open license*,  
99 and *interdisciplinary* participation to support *community consensus*. The strong commitment to  
100 open-access and data provenance is a distinguishing feature of CIViC among somatic cancer  
101 variant interpretation resources. This open approach is necessary to engage participation from  
102 diverse stakeholders including researchers, clinicians, and patient advocates, allowing the  
103 CIViC knowledgebase to evolve with changing needs and standards, and successfully address  
104 the variant interpretation bottleneck.

## 105 106 **Establishing and integrating the CIViC model**

107 Anyone can access the CIViC knowledgebase without login. Users average >3,500 per month,  
108 span the globe, and API access to CIViC exceeds >1,000,000 requests per month,  
109 disseminating content to many more users and downstream applications. The steady growth in  
110 users and self-identified data clients illustrate the diversity of stakeholders, including clinicians,  
111 researchers, and educators, that consume the data (**Figure 1**).

112  
113 Over 300 Curators have to date been recruited to contribute curated Evidence Items, the  
114 foundational unit of the CIViC resource. Each Evidence Item is curated from the published  
115 literature and consists of a free-form summary of the clinical or preclinical evidence along with  
116 structured fields that provide important context such as variant name and origin, evidence type  
117 and quality, clinical significance, and cancer subtype<sup>1,2</sup>. For example, a single Evidence Item  
118 might describe clinical findings from a phase I trial that congenital fibrosarcoma tumors  
119 harboring *ETV6::NTRK3* fusions are sensitive to larotrectinib. Though Evidence Item curation is  
120 one of the most time-intensive tasks in CIViC the knowledgebase has seen steady growth due  
121 to continued volunteer engagement of our Curators. Evidence Items from external Curators  
122 have even overtaken the contributions of Curators from Washington University School of  
123 Medicine, where CIViC originated (**Figure 2**). The responsibility of moderating contributed  
124 content to fit our curation standard operating procedure<sup>2</sup>, which includes evaluation of preclinical  
125 and clinical trial standards, falls to expert CIViC Editors. To meet the challenges of engaging  
126 external Editors, CIViC provides extensive support with live training, training videos, tutorials,  
127 and help documentation (available at [docs.civicdb.org](https://docs.civicdb.org)). For example, two of the 15 Curators  
128 from the Personalized OncoGenomics program<sup>3</sup> (NCT02155621) at BC Cancer (British  
129 Columbia, Canada) have also been trained as Editors, allowing them to curate and moderate  
130 CIViC Evidence associated with real-world precision oncology cases, while also providing  
131 feedback to improve CIViC integration within their program's variant interpretation workflow. To  
132 further address the accumulation of content in need of moderation, we have recruited new  
133 Editors from members of the Somatic Cancer Clinical Domain Working Group (SC-CDWG;  
134 <https://clinicalgenome.org/curation-activities/somatic/>)<sup>4</sup> of the Clinical Genome Resource  
135 (ClinGen), a related centralized resource for interpretation of genetic variants across human  
136 disease. In turn, CIViC has been adopted as the variant curation platform for current and future  
137 ClinGen Somatic Cancer Variant Curation Expert Panels (SC-VCEPs).

138  
139 The CIViC team has established collaborations with the Variant Interpretation for Cancer  
140 Consortium ([cancervariants.org](https://cancervariants.org))<sup>5</sup>, ProteinPaint<sup>6</sup>, NCI Thesaurus, and many others<sup>7-9</sup>. Through  
141 integration with these other valuable platforms, we enhance the CIViC model, interoperability of  
142 cancer-relevant resources, and dissemination of highly curated CIViC data.

### 143 144 **Community-driven evolution**

145 Community engagement is additionally facilitated by in-person, biennial Hackathon and Curation  
146 Jamborees with community-driven discussion topics in the setting of an "unconference" informal  
147 gathering. One previous event explored the utility of germline cancer predisposing variants  
148 being represented in the same interface as second hit somatic variants that drive cancer  
149 development, and led to a patient-initiated collaboration focused on von Hippel-Lindau (VHL)  
150 disease. Somatic, inactivating *VHL* variants are the most frequent genetic aberration in clear cell  
151 renal cell carcinoma (ccRCC), while rare, pathogenic germline *VHL* variants are associated with  
152 VHL disease and cancer predisposition<sup>10</sup>. Approximately 70% of patients with VHL disease will  
153 develop ccRCC, the leading cause of disease-related mortality. Following these community  
154 requests at the Curation Jamboree, Predisposing Evidence was developed as a new Evidence  
155 Type in the CIViC model, to support germline variants in genes associated with cancer

156 predisposition. As a result, CIViC now contains the largest known database of VHL disease-  
157 associated variants. By supporting both germline and somatic variant curation, CIViC is situated  
158 to propel understanding of the complex interplay between inherited and acquired genetic events  
159 in cancer, an area increasingly recognized in clinical guidelines internationally.

160

### 161 **Adaptation to emerging guidelines and types of evidence**

162 Several organizations have published guidelines for evaluating, interpreting, reporting, and  
163 cataloging evidence pertaining to cancer variants and their structured representation in  
164 databases. The 2017 AMP/ASCO/CAP guidelines for the interpretation and reporting of  
165 sequence variants in cancers<sup>12</sup> have been incorporated into the CIViC knowledge model<sup>11</sup> by  
166 developing the CIViC *Assertion*, which aggregates multiple Evidence Items for a clinical variant  
167 classification. Assertions provide a consensus interpretation for the clinical relevance of the  
168 variant in the context of a disease and therapy with all underlying Evidence Items displayed,  
169 allowing for rapid updating as new evidence emerges. Standard procedures were also  
170 developed to support germline variant evidence and interpretation guidelines<sup>13</sup> and add Human  
171 Phenotype Ontology<sup>14</sup> terms to Evidence Items (**Figure 2**). Aggregation of germline evidence is  
172 now supported by Assertions that are given ACMG/AMP classifications<sup>13</sup> (e.g., Pathogenic,  
173 Likely Pathogenic), which provides clinical relevance of a variant to a disease, along with  
174 evidence criteria (e.g., PVS1, PP1, BS1) which assess and codify elements of pathogenicity.  
175 We also added Functional and Oncogenic Evidence Types, allowing evidence curation  
176 pertaining to a variant's impact on protein function or tumorigenic properties and setting the  
177 stage for adoption of emerging guidelines for variant oncogenicity classification<sup>15</sup>. Through  
178 open-access and state-of-the-art programmatic approaches, expansion of the data model, and  
179 collaboration with existing public resources, CIViC is able to fulfill its commitment to adapt to the  
180 needs of the community and evolving guidelines.

181

### 182 **Future perspectives**

183 The global community of CIViC contributors continues to expand, including many new Curators  
184 from the ClinGen SC-CDWG and SC-VCEPs. In collaboration with ClinGen, CIViC is developing  
185 structured protocols to become an FDA-recognized public database of genetic variants.  
186 Upcoming developments including support for complex variant interactions, variant signatures  
187 (e.g., microsatellite instability), and multi-gene copy number and structural variants will address  
188 evolving community needs (**Figure 2**). Since the introduction of CIViC in 2017<sup>1</sup>, we have shown  
189 that leveraging the efforts of volunteer biocurators and geneticists through structured and open  
190 data is a viable and robust way to tackle cancer variant interpretation and support the  
191 democratization of genomics in patient care. This openness and continued access enables  
192 engagement of experts and incorporation into external clinical resources.

193

194 CIViC is a massively collaborative effort that amplifies the skills of biocurators, bioinformaticians,  
195 and developers to produce a knowledgebase equipped to co-evolve with the ever-increasing  
196 demands of the cancer variant-related medical literature. However, this work is only as strong  
197 and diverse as the community that supports it. Therefore, we invite the community to consider  
198 contributing their time, resources, and/or expertise to further enhance this freely available  
199 resource.

210

211 **Figure 1. Evolution of CIViC User Engagement**

212 **A)** The list of CIViC self-identified data clients has grown from the time of initial publication in  
 213 2017 to present ([civicdb.org/data-clients](http://civicdb.org/data-clients)), with many more commercial and academic  
 214 organizations using the web and application programming interfaces (API) anonymously. **B)**  
 215 Growth in user visits with the CIViC web interface (*left*) and the API (*right*), by comparing traffic  
 216 snapshots from January of 2017 (*top*) and 2022 (*bottom*).

217

218 **Figure 2. CIViC data model updates and curation activity**

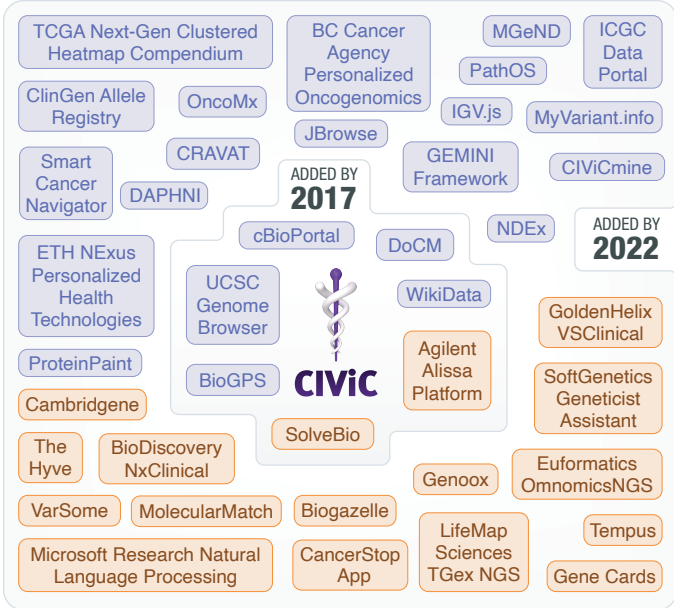

219 **A)** Many upgrades have been made to the CIViC knowledgebase including the introduction of  
 220 Assertions, Source Suggestions, Phenotypes, and linking Drug to a cancer-focused ontology as  
 221 well as the expansion of Evidence Types and Sources. **B)** Early contributions to the  
 222 knowledgebase were performed entirely by internal Curators (Washington University School of  
 223 Medicine, red). However, by 2017, external curation (Community, orange) exceeded internal  
 224 contributions. The gap between internal and external contribution continues to widen as new  
 225 external users adopt and contribute to the knowledgebase. **C)** Statistics describing growth in  
 226 multiple parameters of curation in the CIViC knowledgebase, with the largest growth seen in  
 227 contributors and Evidence Items submitted.
