

Association between socioeconomic status and outcomes in critical care: a systematic review and meta-analysis

Supplementary Digital Material

Table of Contents

Page(s)	
2	Search Strategy for MEDLINE, Embase & CINAHL
3	Supplementary Figure 1. PRISMA flow chart of article selection and retrieval.
4-5	Supplementary Table 1. Table of study characteristics ordered by year(s) of recruitment. Showing study type, country, year(s) of recruitment, participant numbers for socioeconomic analysis (n), Newcastle-Ottawa Score converted to Agency for Healthcare Research and Quality Standard, and Deprivation Exposure.
6	Supplementary Table 2. Study characteristics of number of critical care units involved in cohort and the critical care population assessed.
7-9	Supplementary Table 3. Table of study mortality outcomes ordered by year(s) of recruitment. Showing mortality outcomes, socioeconomic groups assessed, and mortality associations (95% confidence intervals) by specified time points.
10-12	Supplementary Table 4. PRISMA 2020 Checklist
13-14	Supplementary Table 5. Table of studies included in meta-analysis, demonstrating adjustments for potentially confounding variables present in each study
15	Supplementary Figure 2. Subgroup meta-analysis and pooled effect sizes of the association between socioeconomic status and mortality up to 30 days following admission to critical care, including only studies reporting adjusted effect size
16	Supplementary Table 6. Multiple meta-regression of studies included in meta-analysis with year of publication, and population size as continuous variables, and continent of study, type of socioeconomic indicator (area- or individual-level), adjustment for confounders, and measure of effect (HR or OR) as categorical variables.
17	Supplementary Figure 3. Leave-one-out sensitivity analysis, sorted by I^2 , of studies included in meta-analysis of the association between socioeconomic status and mortality up to 30 days following admission to critical care.
18	Supplementary Figure 4. Contour-enhanced funnel plot of the association between socioeconomic status and mortality up to 30 days following admission to critical care units.
19	Supplementary Figure 5. Contour-enhanced funnel plot & Egger's test of the association between socioeconomic status and ICU length of stay.

^aUnadjusted effect utilised for meta-analysis as adjusted effect size not presented

^bFurther data or analysis not presented.

^c Transformed to maintain relationship of most deprived group to reference of least deprived group.

PRISMA 2020 Checklist

Section and Topic	Item #	Checklist item	Location where item is reported
TITLE			
Title	1	Identify the report as a systematic review.	Introduction
ABSTRACT			
Abstract	2	See the PRISMA 2020 for Abstracts checklist.	Abstract
INTRODUCTION			
Rationale	3	Describe the rationale for the review in the context of existing knowledge.	Introduction
Objectives	4	Provide an explicit statement of the objective(s) or question(s) the review addresses.	Introduction
METHODS			
Eligibility criteria	5	Specify the inclusion and exclusion criteria for the review and how studies were grouped for the syntheses.	Methods
Information sources	6	Specify all databases, registers, websites, organisations, reference lists and other sources searched or consulted to identify studies. Specify the date when each source was last searched or consulted.	Methods
Search strategy	7	Present the full search strategies for all databases, registers and websites, including any filters and limits used.	Supplementary Material
Selection process	8	Specify the methods used to decide whether a study met the inclusion criteria of the review, including how many reviewers screened each record and each report retrieved, whether they worked independently, and if applicable, details of automation tools used in the process.	Methods
Data collection process	9	Specify the methods used to collect data from reports, including how many reviewers collected data from each report, whether they worked independently, any processes for obtaining or confirming data from study investigators, and if applicable, details of automation tools used in the process.	Methods
Data items	10a	List and define all outcomes for which data were sought. Specify whether all results that were compatible with each outcome domain in each study were sought (e.g. for all measures, time points, analyses), and if not, the methods used to decide which results to collect.	Methods
	10b	List and define all other variables for which data were sought (e.g. participant and intervention characteristics, funding sources). Describe any assumptions made about any missing or unclear information.	Methods
Study risk of bias assessment	11	Specify the methods used to assess risk of bias in the included studies, including details of the tool(s) used, how many reviewers assessed each study and whether they worked independently, and if applicable, details of automation tools used in the process.	Methods
Effect measures	12	Specify for each outcome the effect measure(s) (e.g. risk ratio, mean difference) used in the synthesis or presentation of results.	Methods
Synthesis methods	13a	Describe the processes used to decide which studies were eligible for each synthesis (e.g. tabulating the study intervention characteristics and comparing against the planned groups for each synthesis (item #5)).	Methods
	13b	Describe any methods required to prepare the data for presentation or synthesis, such as handling of missing summary statistics, or data conversions.	Methods
	13c	Describe any methods used to tabulate or visually display results of individual studies and syntheses.	Methods
	13d	Describe any methods used to synthesize results and provide a rationale for the choice(s). If meta-analysis was performed, describe the model(s), method(s) to identify the presence and extent of statistical heterogeneity, and software package(s) used.	Methods
	13e	Describe any methods used to explore possible causes of heterogeneity among study results (e.g. subgroup analysis, meta-regression).	Methods
	13f	Describe any sensitivity analyses conducted to assess robustness of the synthesized results.	Methods

Section and Topic	Item #	Checklist item	Location where item is reported
Reporting bias assessment	14	Describe any methods used to assess risk of bias due to missing results in a synthesis (arising from reporting biases).	Methods
Certainty assessment	15	Describe any methods used to assess certainty (or confidence) in the body of evidence for an outcome.	Methods
RESULTS			
Study selection	16a	Describe the results of the search and selection process, from the number of records identified in the search to the number of studies included in the review, ideally using a flow diagram.	Results & Supplementary Material
	16b	Cite studies that might appear to meet the inclusion criteria, but which were excluded, and explain why they were excluded.	Supplementary Material
Study characteristics	17	Cite each included study and present its characteristics.	Results & Supplementary Material
Risk of bias in studies	18	Present assessments of risk of bias for each included study.	Supplementary Material
Results of individual studies	19	For all outcomes, present, for each study: (a) summary statistics for each group (where appropriate) and (b) an effect estimate and its precision (e.g. confidence/credible interval), ideally using structured tables or plots.	Table 2 & Supplementary Material
Results of syntheses	20a	For each synthesis, briefly summarise the characteristics and risk of bias among contributing studies.	Results
	20b	Present results of all statistical syntheses conducted. If meta-analysis was done, present for each the summary estimate and its precision (e.g. confidence/credible interval) and measures of statistical heterogeneity. If comparing groups, describe the direction of the effect.	Results & Supplementary Material
	20c	Present results of all investigations of possible causes of heterogeneity among study results.	Results & Supplementary Material
	20d	Present results of all sensitivity analyses conducted to assess the robustness of the synthesized results.	Results & Supplementary Material
Reporting biases	21	Present assessments of risk of bias due to missing results (arising from reporting biases) for each synthesis assessed.	N/A
Certainty of evidence	22	Present assessments of certainty (or confidence) in the body of evidence for each outcome assessed.	Results
DISCUSSION			
Discussion	23a	Provide a general interpretation of the results in the context of other evidence.	Discussion
	23b	Discuss any limitations of the evidence included in the review.	Discussion
	23c	Discuss any limitations of the review processes used.	Discussion
	23d	Discuss implications of the results for practice, policy, and future research.	Discussion
OTHER INFORMATION			

Section and Topic	Item #	Checklist item	Location where item is reported
Registration and protocol	24a	Provide registration information for the review, including register name and registration number, or state that the review was not registered.	N/A
	24b	Indicate where the review protocol can be accessed, or state that a protocol was not prepared.	N/A
	24c	Describe and explain any amendments to information provided at registration or in the protocol.	N/A
Support	25	Describe sources of financial or non-financial support for the review, and the role of the funders or sponsors in the review.	Other Information
Competing interests	26	Declare any competing interests of review authors.	Other Information
Availability of data, code and other materials	27	Report which of the following are publicly available and where they can be found: template data collection forms; data extracted from included studies; data used for all analyses; analytic code; any other materials used in the review.	Other Information

^aUnadjusted effect utilised for meta-analysis as adjusted effect size not presented

^bFurther defined in the study publication

^cAcute Physiology Score component

Supplementary Figure 2. Subgroup meta-analysis and pooled effect sizes of the association between socioeconomic status and mortality up to 30 days following admission to critical care, including only studies reporting adjusted effect size.

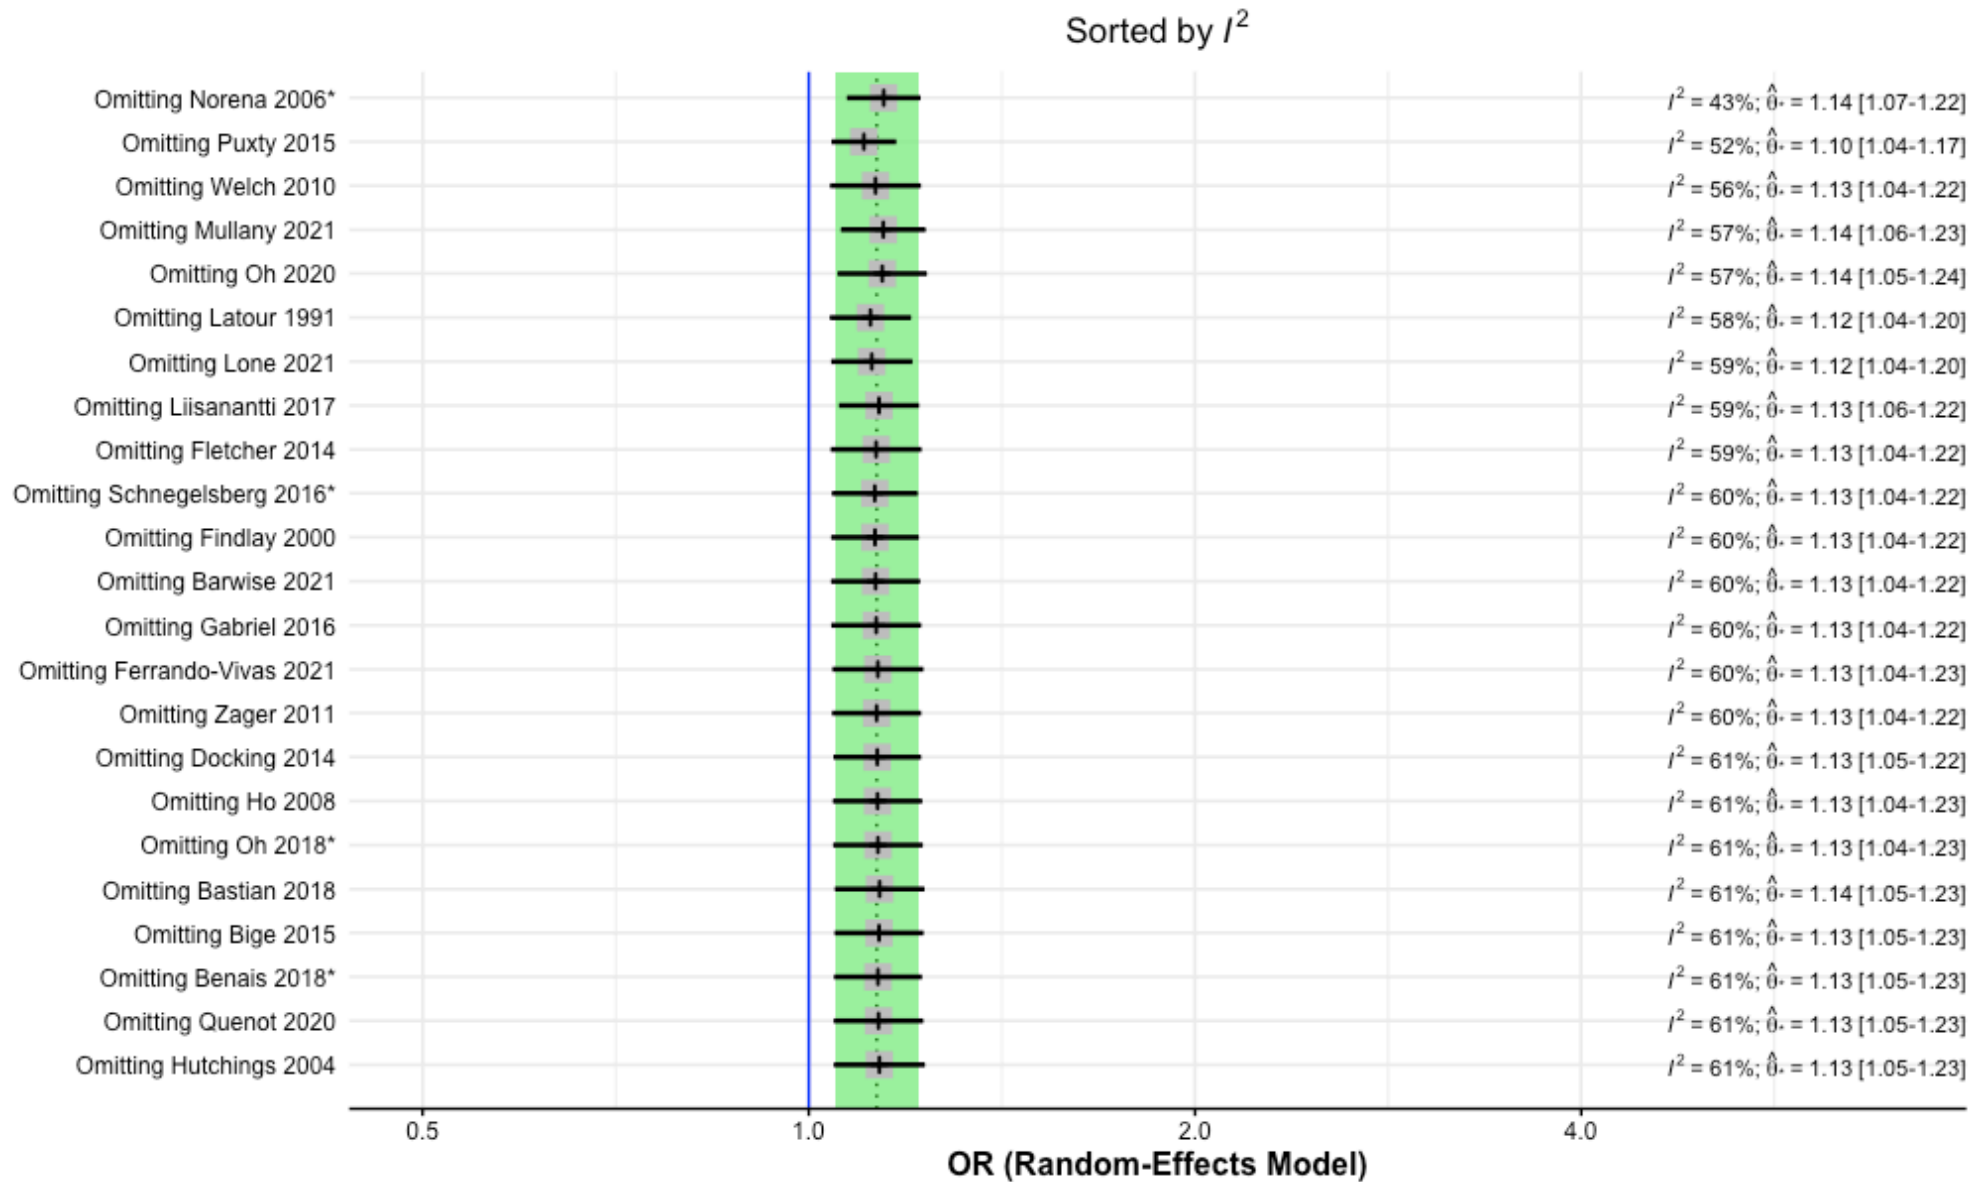

*Using educational attainment socioeconomic status measure

Supplementary Table 5. Multiple meta-regression of studies included in meta-analysis with year of publication, and population size as continuous variables, and continent of study, type of socioeconomic indicator (area- or individual-level), adjustment for confounders, and measure of effect (HR or OR) as categorical variables.

Mixed-Effects Model (k = 23; tau² estimator: DL)					
Tau ² (estimated amount of residual heterogeneity): 0.0174 (SE = 0.0155)					
tau (square root of estimated tau ² value): 0.1318					
I ² (residual heterogeneity / unaccounted variability): 59.44%					
H ² (unaccounted variability / sampling variability): 2.47					
R ² (amount of heterogeneity accounted for): 0.00%					
Test for Residual Heterogeneity: QE(df = 12) = 29.5837, p-val = 0.0032					
Test of Moderators (coefficients 2:11): F(df1 = 10, df2 = 12) = 0.4524, p-val = 0.8910					
	Estimate	Standard Error	t value	p value	95% Confidence Intervals
Intercept	12.6098	18.8312	0.6696	0.5158	-28.4199-53.6394
